10,221. I can instance the case of a common in Surrey, which yielded a certain quantity of water per day very regularly throughout the year, but the quantity being found too small for the supply of a town, underground drainage was carried out with the view of obtaining a larger supply; and should you be surprised to hear that in the summer season no water could be found on that common?—No. I think that that illustrates what I have just now said, that the common acted like a sponge, holding the water and giving it out by degrees; they cut through the sponge, and then they deliver the water more rapidly, and I think that would be the general result of drainage. That is the reason why water power is less valuable than it used to be.

10,222. (*Mr. Harrison.*) Is not a great part of the water that comes down a river in a very droughty season derived from deep-seated springs?—It may be so, probably, in some districts.

10,223. Do you imagine that any mere agricultural surface drainage would stay the water that goes down to those deep-seated springs, or withdraw it?—I think it might intercept some of that water.

10,224. If it is a free soil, and if there are springs out of the chalk, would any drainage in the chalk for agricultural purposes have any effect at all?—I think it is possible that it might cut off some of the water which otherwise would percolate through the chalk.

10,225. It has been stated that in the drainage of a considerable extent of land, the result of a drain passing for a short distance over chalk, and then into impervious strata was, that the water, instead of being discharged at the outlet, was passed into the chalk?—Yes.

10,226. If that was the case with water gathered from a considerable area, would it not be much more the case in ordinary agricultural drainage, where there was a large surface of chalk for the water to pass through?—If the drain passes over a stratum that would absorb the water or allow it to pass into feeders, it would be of no use putting drains in.

10,227. The deep-seated springs are at a considerable depth below the surface of such pervious land?—Yes.

10,228. No surface drainage could affect the springs that issue from such pervious strata?—No, unless they cut them out before they arrive at the point; the chalk comes quite to the surface.

10,229. I can understand the case you have put of a peat bog acting like a sponge placed upon the surface of the soil, and delivering the water out gradually, and that when it was drained the water should be taken away, and that the summer supply should be diminished. I could also understand, if there was a superficial bed of gravel, and you tapped that pretty deeply, and drew off the water, that the discharge in the summer would be diminished; but I cannot imagine that any artificial drainage in pervious strata, such as chalk, the oolites, or any free substrata, can ever diminish the summer flow?—Assuming that there was an imperfectly pervious stratum over a very pervious one, the drains might carry away from the super-stratum the water which would have gone down in time to the very pervious strata to feed the deep-seated springs; but chalk comes so near to the surface, and is so pervious, that land drains would be of no use.

10,230. Have you made any observations upon the volume of water passing down any river in this neighbourhood, taking the minimum flow, and comparing it with the rainfall in the season, so as to be able to say whether the minimum rainfall has diminished of late years?—I cannot say that I have; but it is a matter of observation amongst the millers that the water has been reduced in most of the streams of the district. The people on the Wharfe think so, and a gentleman living on the Addle beck said so at Leeds. I know that that is the general impression, and I believe that it is well founded. I attribute it to improved drainage.

10,231. Do you think that that impression can be a well-founded one, unless you go carefully into the volume of water passing down a river, and compare that with the rainfall?—No; I think it would be a vague impression that might be well founded, or it might not.

The witness withdrew.

The witness put in the following Tables.

TABLE No. 1. (referred to *supra*, Question 10,012.)

STATISTICS of the RIVER AIRE and its TRIBUTARIES.—POPULATION of the Valley of the Aire, from its source down to and including the town of Leeds and its suburbs, at the several periods at which the Census has been taken, from 1801 to 1861 both inclusive; abstracted from the published returns, and divided into districts.

No. and Name of District.	Name of Place.	1801. Population of each Place.	1801. Population of each District.	1811. Population of each Place.	1811. Population of each District.	1821. * The Great or upper weir of the King's Mills at Leeds is about 87½ feet above Ordnance Datum, or the mean level of the sea.

TABLE No. 6.

THE PRIVILEGE of the Soke or King's Mills at Leeds, enjoyed by Charter from Charles the First, was extinguished by the Act of Parliament, 2nd Vict. c. 17. [14th May 1839.]

13,000*l.* was agreed to be paid to the owner by four annual instalments.

Trustees were appointed, who (by s. 35) were empowered to levy a rate, called the "Soke Rate," not to exceed 3*s.* in the pound on all premises used or occupied as maltkilns, or malthouses, or common breweries, and upon all hotels, taverns, and licensed public-houses, &c., where the occupiers brew their own ale or beer.

1*s.* 3*d.* in the pound upon all other hotels, taverns, licensed public-houses, and beer-shops.

4½*d.* in the pound on all premises consisting of a dwelling house and shop, or warehouse connected together, and rated to the relief of the poor at 10*l.* or upwards.

6*d.* in the pound on all dwelling houses not connected with a shop or warehouse, and rated to the relief of the poor at 10*l.* or upwards.

Half the above to be paid by the owner and half by the occupier, and 1½*d.* in the pound on all other rateable property, to be wholly paid by the owner.

With a proviso that no hotel, tavern, or other licensed public-house should be assessed on a higher rental than 120*l.* per annum, though the same may be rated at a higher sum to the relief of the poor.

(Signed) J. W. LEATHER,
Leeds, November 1866.

Mr. S. Blamires.

Mr. SAMUEL BLAMIRES (Bradford) examined.

10,232. (*Chairman.*) You are a soap manufacturer?—Yes.

10,233. Where are your works situated?—In Sedgwick Street.

10,234. Near to Bradford beck?—No, some distance off.

10,235. What number of men do you employ?—Seven.

10,236. What weight of soap do you make per annum?—Rather over 500 tons.

10,237. (*Professor Way.*) Is it principally made from tallow?—Oil and tallow.

10,238. Is any resin used?—None whatever.

10,239. In making the soap do you make your own caustic alkali?—Yes.

10,240. What becomes of the lime which you use?—It is carted away for building brick kilns.

10,241. It is a cheaper sort of lime?—Yes.

10,242. It is used for sticking rough structures

together?—Yes, and for preventing bricks from burning as well.

10,243. When you are causticising your soda you have two products of deposit, namely, the lime which you speak of and the caustic soda?—It is all potash soap, soft soap.

10,244. Do you make it especially for the manufacturers of Bradford?—Entirely so.

10,245. Not for house consumption?—No, except that a few people may buy a small quantity; such as the neighbours.

10,246. It is principally for the woollen trade?—Entirely so.

10,247. Do you separate your soap after boiling?—No separation whatever takes place in soft soap.

10,248. It is boiled down in a much smaller quantity of water than ordinary soap?—It is necessary in making hard soap to separate the sweet principle, the glycerine, from the soap. In our case there is nothing of the sort; the sweet principle is contained in the soft soap, and consequently it gets the name of sweet soap.

10,249. You take a certain quantity of tallow and oil?—Yes.

10,250. Is the alkali which you use a strong solution?—Yes.

10,251. Does the water of that alkali all go into the soap?—Yes, all, except what is evaporated in the act of boiling.

10,252. You use as small a quantity of water as you can?—Yes.

10,253. And the whole product of the soap pan is soft soap?—Yes; there is no waste whatever.

10,254. You have nothing running from your pans?—Nothing whatever.

10,255. You run no liquid away?—No, we should fill the drains if we did.

10,256. Then, so far as your manufacture of soap is concerned, you are not a polluter of the river in any shape or form?—Not in the slightest degree.

10,257. (*Chairman.*) Do you know the state of the Bradford beck?—Yes, I know that it is in a very filthy state.

10,258. Have you formed any conclusions as to what ought to be done to purify it?—With regard to the sewage, I think that it is possible to pump the sewage from the outlet in dry seasons, not in flood time, into large tanks or cisterns, and by means of adding lime, that you might be able to cause a sediment to settle pretty quickly, and to allow the clear water to run away into the beck, though it would not be clean water; by that means you would utilize the refuse.

10,259. Do you think that it is necessary to deal with the rivers in some way, in order to prevent their further pollution?—I think that it is very desirable.

10,260. And to improve them, if possible?—Yes.

10,261. For the trade of the district?—For the trade of the district, and for the health of the town. In summer time the beck is very bad.

The witness withdrew.

Mr. Frederick William Anderton (Bradford) examined.

Mr. F. W. Anderton.

10,262. (*Chairman.*) You are a worsted spinner?—Yes.

10,263. Where are your works situated?—In Leeds Road.

10,264. Are they near the beck or near the canal?—They are within a quarter of a mile of the canal.

10,265. But they are not situated upon either?—No.

10,266. Have you a main sewer coming up to your works, or near your works?—Yes; there is a beck which runs from Bowling.

10,267. You are upon a branch of the beck?—Yes.

10,268. What number of hands do you employ?—About 800.

10,269. What weight of water do you deal with per annum?—We wash about 120 packs of wool a week.

10,270. What weight of soap do you use annually?—We use, I suppose, about 12 packs of solid soap per week.

10,271. And what quantity of oil?—We use oil merely for the purpose of lubricating the machinery.

10,272. You do not use it in the treatment of the fibre?—Yes; it is used in the process of combing.

10,273. Does any of it pass away with the soap water?—Yes, some of it is washed out.

10,274. Is your soap refuse treated so as to extract the oil and grease?—Yes, it is treated on our own premises, which we let to certain parties who conduct the work.

10,275. What are you paid for the material which they get out?—They pay us a certain sum, but we have to direct the application of steam.

10,276. What weight of material do they recover?—I am not aware, for it is entirely under their charge; we have power to interfere, but we do not interfere. They pay us according to the quantity of soap which we consume per week.

10,277. What is that proportion?—It is about 5*s.* on a pack of soap. We find steam and certain things, which brings down the cost.

10,278. It has not occurred to you to attempt to treat the soap refuse yourselves?—No; we think that they are better enabled to do it; they do it for other firms as well.

10,279. When they have treated the waste water, where does it go?—Into the beck which runs from Bowling, and which flows into the Bradford beck.

10,280. Have you noticed whether that water is very dirty, or is comparatively clear?—It is quite clear so far as the eye is concerned, but of course it is mixed with vitriol; they extract the grease from the soapsud with vitriol.

10,281. Have you waterclosets, or privies, for the people upon your premises?—We have both.

10,282. Where do the waterclosets empty?—Into the beck.

10,283. What do you do with the refuse which is collected in the privies?—We have 22 privies which flow into the beck, and four from which the refuse is carted away for manure.

10,284. Would it be very difficult for you to arrange that the refuse from all should be carted away?—No, if we could get people to take it away; but with the four privies which we have, there is the greatest difficulty in the world to get anybody to cart the refuse away.

10,285. But you could so arrange your privies that the produce might be carted away, if you could find a sale for it?—Possibly so, but it would have to be conveyed a little distance from the works.

10,286. Do you use engine power?—Yes.

10,287. What amount of power do you use on the works?—About 400 horse.

10,288. What weight of coal per annum do you use?—About 48 to 50 tons per week, or 2,600 tons per annum.

10,289. What becomes of the ashes?—They are carted away.

10,290. Have you to pay for their being carted away?—Sometimes we have; but now that building is going on, parties are glad to take them away.

10,291. You get rid of them without any difficulty?—Yes.

10,292. Are any of them at any time thrown into the beck?—No, not at all.

10,293. Do you pass any solids into the beck?—No, with the exception of the produce from the privies.

10,294. Do you use much water in your processes?

BRADFORD.

Mr. F. W. Anderton.

14 Nov. 1866.

—Yes; I should think that we use about 18,000 gallons per day.

10,295. Where do you get it from?—We pump it all from two wells.

10,296. What depth are they?—One is 80 yards, and the other is 50 yards.

10,297. What is the quality of the water?—It is very soft.

10,298. Is it alkaline?—There is magnesian lime in it.

10,299. That will not make soft water?—It is very soft in the boilers; there is a deposit as fine as powder.

10,300. Have you had any analysis of it?—I think not.

10,301. Do you take any water from the corporation?—No, except for the offices for washing hands and domestic purposes, and stables, and for similar purposes.

10,302. In what state in your opinion is Bradford beck?—I think that it is about as bad as it can be.

10,303. And Bradford canal?—It could not be worse, I should say.

10,304. In your opinion is it necessary that something should be done to improve the state of the beck, and the canal, if possible?—I decidedly think so; in fact, those who live anywhere near will have to remove from the town unless something is done, they cannot possibly continue to live there. I live within a quarter of a mile of the canal which flows in the valley, and during the summer months we are obliged to be away.

10,305. On account of the smell?—Yes.

10,306. Does it cause sickness to yourself or to any of your household?—It causes sickness to ourselves, and the gardener says, that he has frequently been sick upon the ground while gardening, and the servants in the house complain of it; in fact, the smell gets into our rooms; we have been obliged to go from the rooms facing the canal.

10,307. Did you join the other gentlemen in indicting the proprietors of that canal?—Yes; it was a matter of self defence. I may state that one night we had an escape of gas in one of the bed rooms, at about 12 o'clock at night. We opened the windows to let it out, and the stench from outside was so intolerable, that we shut down the windows, and preferred having the gas to having the stench from the canal.

10,308. (*Mr. Harrison.*) What wool do you use; is it British wool?—We use both English and foreign wool.

10,309. In what proportion?—I do not know; it varies with the trade; I can hardly tell.

10,310. Do you find a great deal of difference in the quantity of refuse from foreign wool as compared with British?—There are what are called white wools and greasy wools, and from the one the refuse is three times as great as from the other.

10,311. Is the quantity of soap which you require to use in the one case very different from that which you require in the other?—No, the greasy wools, as a rule, do not require so much soap as the white wools.

10,312. What wools do you call greasy?—Scotch wools we call greasy, Highland wools; those are unwashed wools.

10,313. Do they not generally wash Highland wool?—No.

10,314. (*Professor Way.*) You have said that you use 12 packs of soap per week?—Yes.

10,315. That would be about a ton and a half?—Yes.

10,316. Is that soft soap?—Yes.

10,317. What is the cost per pack?—78*s.* per pack.

10,318. Is soft soap necessary for you; cannot you deal with soda soap?—Soft soap is used for washing mercantile wools to a great extent.

10,319. The essential difference between soft soap and other soap is, that one contains soda and the other potash; is not that so?—It is the alkali which they mix with it which washes the wool.

10,320. Is not it exceedingly costly as compared with soda?—I do not think that soda would be sufficiently strong for our purpose; it would not be sufficiently searching for the wool.

10,321. Is there more of the alkaline in soft soap?—I should think so.

10,322. If you took ordinary soap and used caustic alkali, do you think that you would get the same result, or would you injure the wool?—One is very particular not to alter much in these matters, if you find a thing test well and not affect your spinning. As a rule you do not wish to use more than a certain quantity of alkali, otherwise you would injure the wool.

The witness withdrew.

Mr. W. B. Hamilton.

Mr. William B. Hamilton (Bradford) examined.

10,323. (*Chairman.*) You are engaged in grease manufacture?—I am.

10,324. You take soap washings from manufacturers and extract grease from them?—I do.

10,325. Where are your works situated?—In Canal Road.

10,326. What number of men do you employ?—Between 8 and 10.

10,327. What weight of grease do you get per week?—Between three and four tons a week.

10,328. Are you constantly employed?—Yes.

10,329. (*Professor Way.*) I suppose that there is no great difference in the mode of treating soapsuds?—No.

10,330. Do you treat them with sulphuric acid?—Yes.

10,331. Can you give an idea of the quantity which you use per thousand gallons of soapsuds?—No, I never measured the quantity of suds which each tank takes.

10,332. But still you do add a given amount of acid to a tank?—We use about half a carboy to a tank, which will contain about 20 tons of sud water.

10,333. That is half a carboy of brown acid?—It will be about 80 pounds of sulphuric acid.

10,334. Of brown acid?—Yes.

10,335. Is the water which you treat the whole of the soapsuds, or only the richest portion of them?—It is generally the richest portion of the soap suds. The solid matter is generally collected in sumpt holes, and farmers put it on the land for manure.

10,336. Do you take the whole of the soapsuds and the wash water to extract the soap, or only the first runnings?—I take the whole of them.

10,337. You have your works put up in the mill yard?—Yes.

10,338. And all the wash water goes into your tanks?—Yes.

10,339. You do not exercise any check upon the time when it passes or ceases to pass into your tank?—No.

10,340. It all goes through?—Yes.

10,341. In what state does the water go out after you have treated it?—Nearly bright.

10,342. Is it milky?—Sometimes it is and sometimes it is not.

10,343. Have you reason to believe that you get the whole of the grease out of it?—Yes, I generally take good care of that.

10,344. Have you ever ascertained the quantity of grease which is in it?—As nearly as I possibly can. For instance, in very windy weather there is very great difficulty in getting the tanks to settle, and that is the only difficulty which I have, but in calm weather we get all the solid out.

10,345. Were you present when Mr. Anderton gave his evidence?—Yes.

10,346. Did you hear him say that he uses 12 packs of soap per week?—Yes.

10,347. That is to say, a little less than a ton and a half of soft soap?—Yes.

10,348. And he receives 5*s.* per pack?—Yes.

10,349. Do you work Mr. Anderton's soapsuds?—No.

10,350. Is that the usual price?—Mr. Anderton has to find steam and other implements for the manufacture of the grease on his premises. I generally take all the soap water from the manufacturer, and find everything myself, and consequently I get the water a trifle cheaper.

10,351. The question is, what quantity of grease, is actually used and what quantity is recovered; would half of that ton and a half be grease?—No, the wool generally takes the greatest portion of the virtue out of the soap. I should say that about a quarter of the amount, or perhaps about 15 cwt. of grease, would be produced out of 12 packs of soap.

10,352. Would the soap, or the grease of the soap, remain in the wool?—No, simply the oil which they use in the manufacture of the soap.

10,353. Supposing that you wash wool, which is greasy, with soap, what is the result?—The grease goes along with the soap.

10,354. And it will be in the water?—Yes.

10,355. Then whatever quantity of grease has been used in the shape of soap, would be found in the soapsuds, even with an addition from the natural grease of the wool, would it not?—It would.

10,356. Then why is there this enormous discrepancy between the quantity recovered and the quantity used in the shape of soap?—A great portion of the grease comes out in the pressing in the shape of a cake, something like the pressing of oilcake, that is another refuse.

10,357. You cannot get out the whole of the grease?—No, it is pressed through canvass.

10,358. Is it not worth getting out?—No.

10,359. Is that burnt?—No, the farmers buy it. I sell it to manure manufacturers, and also to farmers themselves. I sell about 300 tons per annum. Some five years ago the whole of the suds used to go into the beck.

10,360. They find it very good for turnips?—They do.

10,361. So that it is not lost?—It is not lost.

10,362. Do you think that the grease recovered would pay for a better purification of the soapsuds than is now accomplished?—I do not.

10,363. You mean to say that at this moment as much money is spent upon it as can be?—Yes.

10,364. Do you not use bags in the presses?—Yes.

10,365. And those presses are heated with steam?—Yes.

10,366. Is it double case?—No, single case.

10,367. The steam actually goes into them?—Yes.

10,368. Do the canvass bags last long?—They last for from five to six months.

10,369. Are they used several times in a day?—Yes, they are used every day; in and out of the presses they are used all day long.

10,370. Is it the friction or the nature of the liquid which destroys them?—I should say that it is the constant doubling up; the steam, too, will rot them.

10,371. The liquid, of course, is acid?—There is a little acid in, but it is very trifling.

10,372. I may assume that you get as much service out of these soap suds as is to be obtained from them?—I do.

The witness withdrew.

Mr. Alfred Illingworth (Bradford) examined.

10,373. (*Chairman.*) You are a member of the firm of Daniel Illingworth and Sons, of Bradford?—Yes.

10,374. What manufacture do you carry on?—We are spinners.

10,375. Where are your works situated?—In Thornton Road.

10,376. Are you upon any branch or arm of any of the becks?—We do not avail ourselves in any way of them.

10,377. Are you near a branch of the beck?—No, we are at some distance from it. We do not depend upon it in any way for washing or condensing purposes.

10,378. What number of hands do you employ?—From 500 to 600.

10,379. What amount of engine power do you use?—A pair of 50-horse engines.

10,380. What weight of coal do you burn?—From 40 to 50 tons per week; it is variable.

10,381. What becomes of the ashes?—They are carried from the premises, and are disposed of for road making.

10,382. They do not go into the stream?—No, they are mixed to some extent with material.

10,383. Do you use much water upon your premises?—Yes.

10,384. What quantity of water do you use?—About 80,000 gallons a week.

10,385. Where do you obtain it?—From a run of water in the land, which we collect into reservoirs, and we use the condensed water from the engines. We have surface condensers.

10,386. Do you use any of the roof water from your premises?—It passes into the reservoir, but it passes through the engines, and we use it as distilled water.

10,387. Do you buy any water from the corporation?—Not for woolwashing, but for the waterclosets we do.

10,388. You have waterclosets upon the premises?—Yes.

10,389. Exclusively waterclosets?—Yes.

10,390. Where do the contents of the waterclosets go?—Into tanks.

10,391. What becomes of the refuse?—It is carried away upon the land.

10,392. You do not pass it into Bradford beck?—No.

10,393. Then you do not pollute the beck?—Not at all.

10,394. Do you dye at all?—No.

10,395. What weight of soap do you use per week?—About 10 packs per week, at present.

10,396. What becomes of your suds?—They are passed across to the premises of my relatives, where there is an establishment of Mr. Hamilton's, and they are treated by him.

10,397. Where does the refuse soap water go to?—Into the drain.

10,398. And ultimately into the Bradford beck?—Yes.

10,399. So that you pollute that beck, if there is any pollution in the water?—Yes.

10,400. What weight of wool do you treat?—About 100 packs a week.

10,401. Is there any refuse of any sort from the wool?—We have tanks outside the premises into which the soap water passes, and there is a solid deposit.

10,402. Is there any fibrous refuse?—None whatever; at least none which we can avoid.

10,403. Have you any idea about what proportion of the grease in the soap used is recovered from the soap suds?—We cannot tell that; we do not have it under our own management.

10,404. Do you know about what you are paid for the soap water?—Mr. Hamilton has it at a little under the ordinary price, in consequence of his finding his own apparatus.

10,405. That is the gentleman who preceded you in giving evidence?—Yes; he pays a little under 5*s.* in consequence of our having no further trouble with it.

10,406. (*Mr. Harrison.*) Have you ever had an opportunity of seeing the water as it passes away?—No; I do not happen to have noticed it at all.

10,407. (*Professor Way.*) What does your soap cost?—About 76*s.* a pack is the present price.

BRADFORD.

Mr. A. Illingworth.

14 Nov. 1866.

10,408. And you use 10 packs a week?—Yes.

10,409. That is 760*s.*, or 38*l.* a week?—Yes.

10,410. And you get 5*s.* a pack for the grease?—Yes, a little under 5*s.*

10,411. That is 2*l.* 10*s.* out of 38*l.*?—Yes; it is, I think, about 7½ per cent.

10,412. (*Chairman.*) Is there anything further which you wish to state?—Our old premises were upon one of the polluted streams of the town, and one of the principal inconveniences which we suffered then was from chemicals in the water injuring our boilers.

10,413. I presume that you know the state in which Bradford beck is?—Yes.

10,414. And the streams and rivers in Yorkshire generally?—Yes, to a considerable extent.

10,415. In what state do you say that the beck is?—It is in a very bad state. So far as it is covered over within the town, the nuisance to the town is mitigated. There is one exposed place in Thornton Road, the drainage of which seems to be merely a pool, the run of water being so slight.

10,416. Do you think that it is necessary to take notice of the polluted state of the streams in the district?—I should think so, certainly, if there is a remedy.

10,417. For the purpose of trade itself?—Yes.

10,418. The same water being used by one manufacturer after another, it would be desirable, if possible, to limit the amount of pollution passed into the stream?—Yes, our town is so situated that we should want an increased volume of water to a very considerable extent, before anything could be done. The stream which ran past our old premises had from 15 to 20 mills upon it; in summer time the water was so hot that we could scarcely use it for condensing purposes; that was in the early morning, before the full stream was in.

10,419. (*Mr. Harrison.*) What wools do you use?—Both English and colonial.

10,420. Do you find any difference in the quantity of soap which you require?—Not to any appreciable extent. English wool varies, and so does colonial.

10,421. (*Professor Way.*) Something has been said about Highland wool. Do you know of your own knowledge whether there is more grease in the wool of mountain sheep than in other wool; does nature provide a sheep with more grease in the wool in a cold district?—Yes, but more is put on by the farmer for protection.

10,422. Nature does not do it?—No.

10,423. Have you heard of the plan of obtaining potash from wool?—Yes.

10,424. Did it strike you as a novelty when you first heard of it?—It is done in France. I do not know that it is done in the neighbourhood of Bradford.

10,425. Are you conversant with that process?—No. Messrs. Isaac Holden and Sons have a wool-combing establishment in France, where it is carried out.

10,426. (*Chairman.*) And where it is carried out so as to pay?—Yes, on some classes of wools; greasy wools.

10,427. (*Professor Way.*) It pays three per cent. upon the weight of the wool?—Yes.

10,428. (*Chairman.*) Do you know what that wool is?—It is greasy French wool.

10,429. (*Professor Way.*) Is that a secretion of the animal's system; is it natural?—It is unquestionably natural.

10,430. (*Chairman.*) Is there any place in England that you know of where that potash is recovered?—Not that I am aware of, but there may be.

10,431. Are you aware of any reason why it should not be recovered in England?—No, excepting that in the worsted districts a much smaller portion of that description of wool is used than in France.

10,432. (*Professor Way.*) Such a quantity of potash is not common to all wool?—Certainly not.

10,433. Then if it is peculiar to some kind of wool, does not that point out some accidental circumstance?—There is naturally a considerable amount of potash in all wool, but most of the wool which comes to these countries is washed; that is the case with the colonial wool.

10,434. Then the potash has been taken out before the wool comes to you?—Yes.

The witness withdrew

Adjourned to to-morrow at 10 o'clock.

Bradford, Thursday, 15th November 1866.

PRESENT:

ROBERT RAWLINSON, ESQ., C.B., IN THE CHAIR.

JOHN THORNHILL HARRISON, ESQ. | Professor JOHN THOMAS WAY.

HENRY WILLIAM RIPLEY, ESQ. (Bradford), examined.

H. W. Ripley, Esq.

15 Nov. 1866.

10,435. (*Chairman.*) Are you president of the Chamber of Commerce for this district?—Yes.

10,436. You are engaged in the Bradford trade?—Yes.

10,437. In what department of that trade?—I am a stuff-dyer, that is my principal business here.

10,438. You have, I believe, connexion with some other department also?—Yes, I have connexion with other branches of the trade.

10,439. How long have you resided near Bradford?—I was born in the borough.

10,440. You remember Bradford and the neighbourhood since your boyhood, do you?—Yes.

10,441. And you remember the state of the becks and the river at that time?—Yes, I remember the state of the becks certainly.

10,442. Have you prepared any details as to the growth of the local trade of Bradford and the growth of the population?—No, I have not attempted to give any actual figures or details, but I can give some general information.

10,443. Do you know how many Chambers of Commerce there are in Great Britain?—Between 30 and 40 I believe.

10,444. Are they all in communication with each, other?—The greater number of them are. Nearly 30 are in communication with each other.

10,445. You are self-constituted and independent bodies in your own localities?—Yes, but conferring together generally on subjects which are for a common purpose.

10,446. What are supposed to be the duties of your Chamber of Commerce?—Primarily it has to attend to the interests of the district, to communicate with Government on any matters that may affect the trade generally having reference to our foreign arrangements, and to negociate with foreign countries through our own Government for the alterations of tariffs where they unfortunately exist.

10,447. In the event of legislation being necessary for prevention of pollution of rivers, would that, in your opinion, be a fit subject for the intervention of your Chamber of Commerce, for instance, to consider any proposed Act of Parliament?—I think it would be a very proper question to be submitted for the consideration of the Chamber of Commerce.

10,448. You have not only to compete with the home trade, but you are necessarily brought into competition with foreign trade?—From time to time we are very closely indeed.

10,449. I suppose that, communication with foreign countries being so swift and rapid, any serious interference with the English trade might place you at a disadvantage with foreigners?—As a matter of fact this particular district has lost a great part of one branch of trade in consequence of the close competition with France, but fortunately other branches of trade have sprung up, so that we have not felt it so much as would otherwise have been the case.

10,450. Would you say that in legislating for prevention of pollution of rivers, great consideration should be given to the probable cost that would be thrown upon the English manufacturers?—I think the whole question should have the most careful consideration. While, on the one hand, it is important to prevent pollution, on the other hand the greatest care should be taken not to theorize merely as to the course which is to be adopted for the prevention of that pollution, otherwise what might appear a little matter to parties not engaged in trade might be very serious to the parties themselves, and, in point of fact, it might have the effect of either removing trade from a particular district or from the country, competition being so close in many branches of business.

10,451. Is it within your cognizance, as president of your own chamber of commerce, what would be the gross sum dealt with in trade in your district?—It is a very difficult thing to give even an approximate estimate of the actual value of the trade of the worsted district for instance, and by the worsted district I mean not merely Bradford, but Halifax, Keighley, Bingley, and the whole of the surrounding neighbourhood where the worsted trade is carried on in contradistinction to the woollen trade which exists at Leeds, Huddersfield, Dewsbury, and Batley. It is impossible to separate the trade of Bradford from the trade of Halifax and adjoining places.

10,452. Suppose you take the woollen trade of Yorkshire, can you give us within half a million the sums that are involved in the woollen manufactures?—I should prefer confining my estimate to the worsted trade, leaving the woollen trade out. I do not think I have any data as to the woollen district. Having a pretty intimate knowledge of the capacity of the various dyeing and finishing establishments in the district, I have calculated the quantity of pieces which each is capable of dyeing and finishing and that gives, I believe, very tolerably correct data on which to base the quantity of goods that pass through the merchants' hands, and the amount at which I so arrive is between 6,000,000 and 7,000,000 pieces of goods annually. The average value of those pieces will I take to be, about 50*s*.

10,453. What would the length of the pieces be?—They vary very much in length, from 28 yards to 60 or 70 yards. The great majority of them are of an average length of about 50 yards.

10,454. What is the weight?—The weights vary very much indeed also; but the average weight of the great majority will be from 6 lb. to 7 lb.

10,455. (*Mr. Harrison.*) A good deal of stuff is sent to Leeds to be dyed, is there not?—Yes. Taking 6,000,000 to 7,000,000 as the basis, the entire value of those goods would be from 17,000,000*l*. to 18,000,000*l*. Then we have an export trade in yarn, amounting to between 5,000,000*l*. and 6,000,000*l*. Then we have a trade to Scotland, to Norwich, Manchester, and on a small scale to other parts of the kingdom amounting possibly to 3,000,000*l*. I think I have correct data for making, in round numbers, the value of the trade of the district, of the textile worsted trade, to be about 24,000,000*l*. or 25,000,000*l*. per annum.

10,456. (*Chairman.*) I assume that in all cases where that trade is carried on water is used to a large extent, and a considerable amount of pollution arises from the trade at present?—Water is used in large quantities by the manufacturers. It is used for two operations, to scour the wool and for condensing purposes in the engines. In the one case the water is fouled, and in the other it is merely heated and passed away.

10,457. The question of rivers pollution is intimately connected, is it not, with the expenditure of that vast mass of money annually?—Yes, especially in connexion with the dyers of the district.

10,458. If those annual sums were capitalized what would be the sum?—500,000,000*l*. at five per cent.

10,459. Is there land in Yorkshire worth 500,000,000*l*. including all the rivers?—If I had the money I do not think I should like to give it for all the land in Yorkshire. The interests at stake are of startling magnitude, when you look at the question from that point of view.

10,460. The interest engaged in trade are of that magnitude that you think too great attention cannot be given to them?—Yes.

10,461. It is a question that requires handling with the greatest care?—Yes. I believe you would find the greatest willingness on the part of persons engaged in trade generally to listen to every suggestion that might be made, and to do all that was in their power to remove nuisances, but if the time should come when they are interfered with in a way that they think injurious to themselves, you will find them rising as one man to protest against the ruin which would be brought upon them.

10,462. Is it your opinion, considering how large the interests are now and how enormous the capital is represented to be, that the business is a growing one?—It is a very rapidly growing business. It may appear from one point of view, looking at the statistics of the Bradford trade, in the decennial period from 1851 to 1861, that there was no large growth in the trade, but no greater mistake can be committed. During that time a transition was taking place in two processes of manufacture. Wool-combing, which had been before that period principally carried on by hand, was during that time, and since, changed to a process of machinery whereby, speaking roundly, six or eight men now do the work of at least 100. By that means during those 10 years the labour of many thousand hands was saved; during the same period the power-loom also was rapidly undergoing improvement, and those two causes made the district appear almost to have a stationary population, whereas in point of fact the trade of the district, I have no doubt, nearly doubled itself.

10,463. That is in value?—Yes. I have no doubt now we are growing in population in consequence of those causes which existed in the period between 1851 and 1861 having ceased to exist, that is, machinery has come to a comparative state of perfection. I believe that we are now growing in population very rapidly, indeed almost unprecedentedly. The increase in the export of yarns between 1849 and the last Board of Trade returns is from 1,500,000*l*. to 5,500,000*l*.

10,464. May we take it that this trade has concentrated itself in Yorkshire partly in consequence of the water, and partly in consequence of the facility for obtaining coal?—It cannot have concentrated itself in Bradford in consequence of the water. It probably has concentrated itself in Bradford from two causes—one is, the cheapness of fuel, and the other is the superior energy of its inhabitants during the last 40 or 50 years; then the worsted trade was located principally at Wakefield and at Leeds. Wakefield appeared at that time as if it was to be the seat of the worsted manufacture, but the trade transferred itself here at a time when we really had no very large supplies of water, except what we obtained at some considerable cost from underground sinkings and borings.

10,465. You are the principal stuff dyers?—Yes.

10,466. You are, I believe, the owner of a number of mills?—Yes, I am.

10,467. What number of hands do you employ?—Between 500 and 600; they are principally men.

10,468. What amount of material do you get through in a year in pieces?—In number between 700,000 and 800,000. The average weight is about 8½ lbs. I may state that the goods which pass through our hands are of a class somewhat better than those which pass through many other dyers' hands, and our average weight is higher, I have no doubt, on that account.

BRADFORD.

H. W. Ripley, Esq.

15 Nov. 1866.

10,469. You carry on, I suppose, about one-tenth of the whole business?—Quite, and perhaps rather more.

10,470. What number of pieces do you dye?—About 500,000 of the 800,000 are dyed, and between 200,000 and 300,000 are finished.

10,471. What is done with the refuse from the dye vats?—The refuse from the dye vats is passed in our case into subsiding tanks or ponds in order to separate the solid matter from the liquid. Having a number of mills of my own, and there being also a number of mills lower down on the Bowling beck, which are sometimes short of water, I have made arrangements to supply them with water for condensing purposes by means of pipes laid along the railway. Our works are situated on Bowling beck, a mile from the centre of the town. On the course of that beck mills have been erected from time to time during the last 30 years, without any means whatever for a water supply, and for many months in the year, as the Bowling beck above our works in a dry season for months continuously is only an imaginary stream there is no water whatever. When there is any water we have reservoirs in which we have always, in my recollection, intercepted the water and used it at our own works; but the whole quantity of that water for many months is so small that the mills below have really a very precarious source of supply. That led to litigation some years ago between the mill owners, and ultimately I agreed to construct subsiding dams to separate the solid matter from the dye water, and then to pass the water down to those mills; they used it for condensing purposes, and then passed it again into the beck. Our source of water supply at our own works is twofold. We pump from some old colliery workings, which extend under many hundred acres in that district, from 1,000,000 to 1,200,000 gallons a day of hard water, which contains a large quantity of sulphate and carbonate of lime, but it is very good water for washing and many dyeing purposes. We also pump from the flagstone, which underlies the coal 50 or 60 yards, constantly about 600,000 gallons a day of pure soft water, which is perfectly free from any hardness whatever. That water is used in our own works for scouring purposes. Then by a system of pipes I supply a considerable number of mills with water for scouring their wool, the water being softer than any other that they can get, and I also supply a large number of dwelling houses. Half a million of gallons of pure soft water are used daily in that way; the mills down the stream are supplied from those subsiding dams before named with water; it answers their purpose for the boilers better than the natural water of the stream. The combinations which take place in our dyeing processes make the water in such a state that it keeps the boilers free from incrustation, which is not the case with the water in its ordinary state; and the millowners are thankful to have this water as we send it to them. With regard to the refuse, these subsiding dams have been made to a certain extent for my own convenience as well as for the convenience of the other mills, and I consult my own convenience in discharging the refuse. Generally the contents of one subsiding tank are discharged into the stream on a Saturday afternoon when the mills are standing.

10,472. In pumping this water you have a pretty fair chance of ascertaining whether it varies in volume at any particular time of the year, or from year to year. Do you find any variation in it?—The water from the old colliery workings varies very much in quantity according to whether it is a wet or a dry season; but the area is so large from which we pump, that even in the driest season which I ever knew (the summer before last), when we pumped the water down so that we could get into the old colliery workings, still we had sufficient.

10,473. You lower the head of the water, but do not exhaust the source?—There is a kind of underground reservoir; we exhausted it last summer; we pumped it nearly dry; we were nearer aground for a few weeks during the summer of 1865 than ever before. As to the soft water which comes from the flagstone, which underlies the coal about 60 yards, that is always sufficient in quantity to supply our pumps even night and day, but the level of the water in the pumping apparatus will lower very materially as between one season of the year and another.

10,474. How much does it lower?—Fifteen or 20 feet I should say.

10,475. At what time of the year will it be the lowest?—In ordinary seasons, it will be the lowest in November and December after the summer has passed, and previous to the rains, from which this supply comes by some unknown underground channels.

10,476. When does it get to its maximum?—By about March or February, and so it will remain to May or June without material variation in the level.

10,477. What ingredients do you use in dyeing that would have a softening effect upon water?—I do not say a softening effect, but a qualifying effect; there are a great variety of ingredients; the great consumption is in dyewoods, logwood, peachwood, etc.

10,478. Are there any acids?—Yes, we use large quantities of acids, and mordants, in working dye wares generally.

10,479. The acid diluted as it is in the water is found to have a beneficial effect on boilers?—Yes, the acid becomes neutralized I apprehend in its passage through the various operations; in fact the acid is not used in its natural state. Nitric acid is first made into nitrate of tin; muriatic acid is made into muriate of iron, etc. If you examine steam boilers that have had this water in them for many years you will find that they are cleaner now than they were previously; naturally there is a certain amount of sediment from the water containing large quantities of lime which adheres to the boiler, and is very difficult to get rid of.

10,480. Do you supply any of that water, or is any used for locomotive purposes?—I did supply the Lancashire and Yorkshire Railway for several years with it. We tried experiments with water from the subsiding dams for their locomotives occasionally, but the tubes of all the locomotives were found to be so fouled with incrustations of lime from, perhaps, the bad water which had been used before that the result was not satisfactory; but I never had the thing fairly tested.

10,481. They were not new boilers with clean tubes?—No. There is always a small amount of sediment in our dye-water from the subsiding dams, which is used by the mills below. It would be necessary to pass it through some filter in order to separate that sediment.

10,482. In managing your works what arrangements have you made for the soil of the workpeople; have you waterclosets or privies?—At all the mills and weaving sheds I have adopted, with the exception of one that was built 20 years ago, a system of waterclosets.

10,483. Where do they empty their contents?—The stench from privies in ordinary mills was so excessively offensive that in commencing to build some mills 10 or 12 years ago I adopted a fresh system, and I put in then, and have done so since, waterclosets, or rather long troughs. They are filled with water by a ball tap to within four inches of their height, and all the deposits are made into them during the day, and a man goes round at night, draws the valve, and the whole flushes out instantly down a pipe into a subsiding tank in the yard of each of those premises. There is no outlet except at the very top of this tank by means of a drain pipe, which is covered with a fine grating, and the result is that the great mass of solid excrements is retained in the tank, but the liquid passes away into the watercourse beck or stream.

10,484. You do not utilize it for agricultural purposes?—Yes, from time to time. I have tenants who sell it if they can. They say that they have to pay something for it to be taken away for agricultural purposes. I believe it to be a valuable manure.

10,485. Have you seen any of the new earth closets?—I have seen drawings of them.

10,486. Do you ever go to Wakefield?—Yes, occasionally.

10,487. I understand that they are going to try the experiment in the basement storey of the prison there?—The tank I use produces no nuisance of any kind in the neighbourhood where it is used. You are not conscious of its being there. At intervals of two or three months the solid is taken out, and the tank is emptied. As a question of nuisance, I am convinced that my plan cannot be improved upon, but on the question of utility I cannot speak.

10,488. It is a much cleaner and better process than the other, the cesspit and midden process, is it not?—Yes. They were perfectly horrid before. I am going to build about 300 cottages, and I am so satisfied with my plans that I shall adopt the same principle in all of them I do not like to see cottages with nasty privies about them. I am putting a watercloset in each, and shall have an intercepting tank to carry out the same idea.

10,489. Do any of the other manufacturers in this district adopt subsiding dams for their dye refuse?—No, I think not.

10,490. Are the results to you so satisfactory that you think you could recommend other persons to adopt the same means if they had the opportunity?—If they could utilize the water, or if they had any object in it, I think it is desirable that they should do so. In adopting these subsiding tanks, or ponds, my idea was that the water would take a considerable length of time in depositing all the solid refuse, and on that account I built at once three tanks, two of them being 120 feet long by 50 or 60 feet wide, and the other 120 feet long by about 40 or 45 feet wide; but in practice the deposit in the small tank of about 120 feet long by 40 feet wide, with a varying depth of from about seven or eight feet to nine or ten feet, is so rapid that the great mass of solid matter is deposited in the first tank. I am now using the other two ponds or dams as supply reservoirs for the mills, and the first-named answers the purpose for deposit. At present it is not only not an expense but an actual benefit, because it supplies the mills below with water. If the dyers had to collect the refuse and dye wares which deposit so rapidly in one of those tanks, a very serious question would arise. What are they to do with it?

10,491. If the prevention of pollution were made imperative, might not a number of the dyers be combined, and be required to pass the refuse water into one common outlet, so that it might be treated in one settling pond?—I think that is quite impossible. Dyeworks generally are so far from each other, and their interests are so different, that disputes would arise if they had subsiding tanks in common. The size of the tank that would be required for very large works for merely depositing the refuse would not in any case be a very serious objection, I think.

10,492. (*Professor Way.*) Do you use those tanks alternately?—No; the deposit is so rapid in the tank I mentioned, and it can be flushed into the beck during a half-holiday. Last night I ordered the contents to be slowly let out in order that you might see the state of the collection that has taken place since last Saturday week, the quantity and quality of the sediment. If instead of passing this refuse into the beck or watercourse, the sediment was taken out, it would be imperative then to have two of these tanks to be used alternately. Then the question would arise, having this immense mass of material collecting, what is to be done with it?

10,493. Do you think, that if you were compelled to empty the tanks by hand, and not to pass the contents into the beck, liming or any other process could make the refuse useful as a manure?—From time to time, for the last 12 or 15 years, I have mixed it with lime, and I have mixed it with nightsoil, and applied it to grass land—to arable land, but always with one result; the land becomes for several years perfectly barren, you could not get a crop off it.

10,494. It proved in practice to be injurious?—It proved to be so injurious that I am quite sure, from a long course of experience with reference to the refuse from dyeworks, it is not feasible to apply it to land advantageously for any agricultural purposes.

10,495. Supposing you were still compelled to dispose of the refuse without passing it into the river, and to make what is called a spoil bank of it, what area of ground would you have covered, do you think, at your works in the course of 10 years?—We have done that also for two or three years; large quantities of our dye wares now are not put into vessels to dye the goods, but the colouring matter is extracted in closed iron or copper vessels, and of course, this has to be taken out under any circumstances, it does not pass away; and for two or three years this refuse, amounting to many hundreds of tons, was put in to one solid heap in the vain hope of its rotting. For a period extending over four or five or six or seven years, I do not think any addition has been made to that heap. During this last summer we dug into it, and found it in the same state in which it was originally heaped up; that is, the spent wood.

10,496. (*Mr. Harrison.*) That is not the deposit in the tank?—No; but it is the same description of material. One of our people suggested that it might be possible to burn it, and they lighted fires in this heap some months ago, and the result is, that the heap has been almost burned down; half a dozen carts would carry the whole away. I could burn the refuse without very great inconvenience, but it would be a more difficult operation in connexion with many premises that are more closely surrounded with other buildings. The most feasible mode of getting rid of the refuse in my opinion is to burn it.

10,497. (*Chairman.*) Other parties would have to cart the refuse to some place where it could be so disposed of?—Yes; it might be done in that way.

10,498. You say that you would burn it. I suppose you are aware that ordinary clay can be burned by mixing small coal and refuse with it, which is used as ballast for railways in place of gravel?—Yes. I have seen that done frequently.

10,499. If this refuse is useless for agricultural purposes, there is still that mode of getting rid of it?—Yes; we had got so large a heap that we were afraid to continue to heap it up, but now that we have got rid of it we shall commence again to collect another heap and burn it in the same way.

10,500. Are you aware that at Huddersfield they burn the spent wood to a great extent under the boilers?—Yes; but that can only be the case where they use chipped wood. Stuff dyers generally use rasped wood, which is more economical, where it can be used. Chipped wood in limited quantities can be used under boilers.

10,501. (*Professor Way.*) I suppose that its indestructible quality is greater when rasped than in the natural form, as is the case with sawdust?—Yes.

10,502. Because all the juices are taken out in the treatment of it, and you have nothing but the woody fibre?—Yes. In addition to that, you have a combination of a stringent matter and sumach, and so on; the refuse is all but indestructible except by fire; it is valueless, and worse than that as a manure.

10,503. What you get in the subsiding tank is a totally different thing, is it not?—No.

10,504. The stuff which is precipitated from the dye water is the same kind of stuff as is fixed in the cloth which is dyed, is it not?—The greater mass is precisely similar to the material of which I have been speaking, the solid material.

10,505. It is not produced by the mixture of the different liquids?—No; it remains in solution to a considerable extent in the water which passes out from the deposited matter.

10,506. When dye water is allowed to rest, does it not subside into a precipitate with a tolerably clear liquid?—Never; we have tried ours, and we have never seen it so subside.

10,507. It cannot be filtered, can it?—Yes, of course, theoretically it can be, but practically I fear it

BRADFORD.

H. W. Ripley. Esq.

15 Nov. 1866.

cannot. A bed of ashes will filter the foulest dye water into perfectly clear water, so that you might almost drink it, but a bed of ashes becomes fouled very soon. It is impracticable to carry that system out.

10,508. The great difficulty in dealing with subsided matter in those tanks is that it is in a state of slush, and you cannot dry it?—The moment you begin to deal with large masses, the labour is so very costly that it becomes a very serious matter.

10,509. After all the quantity of solid matter is small as compared with the quantity of liquid that remains mixed with it after it has subsided, and it is very wet?—Yes, it is.

10,510. That would constitute your greatest difficulty, would it not?—In wheeling the stuff from subsiding tanks, of course, the water would drain out to some extent.

10,511. The quantity, which might not be large if it was dry, is very large in a state of sludge?—Yes; but it is not in that state two or three days afterwards. After the tank has been emptied it will not be in an actual state of sludge, it will be material that can be cut with a spade.

10,512. But in that state it contains large quantities of water?—Yes.

10,513. (*Chairman.*) What weight of coals do you use per annum?—About 20,000 tons.

10,514. What weight of ashes does that quantity yield?—That varies very much according to the decription of coal used. Lowmoor coal makes a very much smaller quantity of ashes than coal which comes from between this place and Wakefield. I should say from 15 to 20 cartloads a day.

10,515. What weight would a cartload represent, one ton?—Not so much as a ton of ashes.

10,516. What do you do with your ashes?—The Lancashire and Yorkshire Railway is contiguous to our works, and also there is a branch into our works from the Great Northern Railway, and these two companies are thankful to take all our ashes for ballast.

10,517. Do you tip any of the ashes into the river?—Not now. So long as I can recollect the Bowling beck, which in the winter becomes a large stream, they were wheeled principally all along the side of the watercourse.

10,518. That is parallel with it?—Yes; and when the floods came in winter the ashes were all washed away, but it was many years ago that the ashes were so dealt with.

10,519. Looking at the enormous weight of coal used in Yorkshire, and the enormous weight of ashes resulting from it, should you say that it would be advisable that they should be kept out of the stream?—By all means; it is perfectly monstrous now-a-days that any ashes should be put into the watercourses.

10,520. Are you aware whether it is the practice in certain parts to throw ashes into the streams?—No, I think not.

10,521. Is it not he case in Bradford?—No, I think not.

10,522. Would you be surprised to learn that upon every one of the streams that flow into the Aire and Calder there are thousands of tons of ashes per annum thrown in?—I can conceive that in some outside country places they do as our people did at Bowling 30 or 40 years ago.

10,523. Do you think it would be a legitimate interference on the part of the State with trade if they said that it should not be done?—I think there would be no difference of opinion on that question.

10,524. With regard to the pollution of the river by sediment from reservoirs or tanks, at present you put your sediment in, and it is not complained of?—We put it in as a matter of right, in point of fact we claim a right to put it in.

10,525. Would you like to be interfered with in that matter?—I have no objection to the whole question being very carefully discussed and considered, and if any feasible mode, which shall apply generally, can be brought to bear, and I think to some extent it might be, we should be glad to co-operate. I have given you strong proof of my willingness to co-operate. The 200 or 300 tons of refuse dyewoods which I produce in a year, I shall, now that I am satisfied that it is feasible, for the future not pass any into the stream, but burn it without material cost.

10,526. Have you tried what effect the ashes resulting from the burnings would have upon agriculture?—No; it is only recently that I ordered them to be collected in a few casks and let me have them at my farm, but whether that has been done I do not know.

10,527. It may turn out that although the solid material is not useful the ashes may be?—Yes, to a certain extent, I have no doubt they may be for manure.

10,528. Are you aware that generally throughout Yorkshire the sediment from the lodges attached to each mill is flushed out into the river, and passed from one mill to the other from Saturday night to Sunday night?—No, I am not aware of that.

10,529. Supposing there are 50 mills upon a stream in a course of 50 miles, each having a dam, does not this occur, that the one highest up first flushes his lodge into the stream, the next below him receives the mud so sent down, and he has no remedy but to flush it out in like manner. The next man gets the combined result of the two, and so it goes on down the stream. At last the flat reaches of the river become shallow, and the Navigation Company have to dredge out the deposit, or it so shoals that the river floods the adjacent land; whereas if the sediment were taken out by each manufacturer it would be a minimum to him, he would free himself and not injure his neighbour below him; he would also be free from the mud of his neighbour above him. But at the present time is not the state of things what I have described?—Yes, but a serious question arises there: how, except by flushing, is he to get it out without stopping his works?

10,530. He can easily get it out. Nothing is easier than to dredge it out upon a similar principle to the dredging operations upon the river below. It can be dredged out in the same way?—Theoretically it looks so, but I am not so sure that it is so practicable. In the first place a man wants his water clean, and you would stop his works as it appears to me.

10,531. But the sludge goes in and deposits itself in the first quiet place, and the accumulation of mud for one day will render the water unfit to use perhaps for a month for everbody below?—Yes, that I can quite conceive.

10,532. Do not you think that, if practicable, some means should be provided to remedy that state of things?—Yes, if practicable.

10,533. And that each person should contribute a certain amount towards preventing it?—That involves the whole question. After careful investigation as to what is desirable to be done, it appears to me that the circumstances elsewhere are somewhat different from the circumstances that exist here generally on our streams, because we are so limited in the supply of water.

10,534. (*Professor Way.*) You use the streams rather as a means of getting rid of the refuse water when you have done with it than as a supply, do you not?—We should be glad to use the streams of clean water if we could obtain access to them, but we are so far from them.

10,535. The view you would take would be different if you were dependent upon the refuse water for your supply as well as for your easement; take, for instance, the mills that are upon the river Calder, where they have to use the river water for the purposes of their trade, and where they also use the river as an easement for their works?—I think that every practicable means should be used, not only here, where the streams flow into the river, but also on the rivers themselves, to keep out as much pollution as is feasible, consistently with not trammelling the manufacturers to a degree that might be prejudicial.

10,536. The view which the Chairman was bringing before you was this, that you do incur a very large expense each time that you clear out what you have thrown in, that you make the river impure, and have

to deal with it afterwards as well as you can ?—You mean the country has to do so.

10,537. Upon the whole manufacturers are doing over and over again what each might once do individually, that is the result ?—Yes; but it appears to me that the difficulty is to show them a way of dealing with the refuse they get out, that is, I think, as difficult a question as clearing it out. I think that many manufacturers, dyers, and others, would not half so much object to getting the refuse out of the stream as to dealing with it when they get it out, it being in such large masses, what are they to do with it ? I think that that is the more difficult question of the two.

10,538. (*Chairman.*) Would not the answer to that be exactly the same as it must be in the case of ashes; there are gentlemen in Yorkshire who pour in ashes from 2,000 or 3,000 tons of coal per annum, and never take a spadeful away, and they will turn round with the same objection, and say, We cannot take the ashes away without costing us money; show us how we can do it, for that is no part of our business ?—The case is not exactly parallel, for it appears that ashes are thrown into the stream in some country places.

10,539. In Huddersfield by the County Bridge there are two mills, where you may see in a dry season ash-heaps projecting over to the opposite bank, waiting for the first flood to take them away ?—With regard to the ashes in this neighbourhood, there is often a considerable demand for them during the last summer, and occasionally in years past, they have been fetched from the manufactories by parties who begged for them.

10,540. Not only are streams obstructed by ashes, but if any riparian owner is excavating foundations or making a new road across his land, and the river is the readiest tipping place, the solids go in ; and from the highways bordering the rivers the surveyor has the mud scraped off, and the readiest place being the river, in go the scrapings ?—Yes.

10,541. Do you think it is a proper reply to make that that is the cheapest method of getting rid of the refuse ?—Not in itself.

10,542. (*Professor Way.*) Somebody or other has to dig out those ashes afterwards ?—Not always, I apprehend.

10,543. (*Chairman.*) The consequence is this, that the beds of those streams are, by the manufacturers, own confession, rising year by year, and the floors of their mills, which were before dry, are now flooded to the serious damage of the manufacturers ; the mills that had a certain water power are impeded, because the tail water cannot flow away, and all these people are suffering from their own misdeeds, none of them have the means of remedy, they cannot interfere with the river to improve it, but they can all do something to make it worse ?—All that is not a sufficient reason, in my opinion, for interfering with the large manufacturing interests of this country. Those mills which exist on the sides of the streams, and which are worked by water power, are comparatively of a very subordinate character as compared with the great mass which are worked by steam power. If that was the only injury that occurred I should say, leave things as they are; your remedy would, on the whole, be worse than the evil.

10,544. You would let them fill the river up ?—I should not have any apprehension as to the water-courses being continued in the same way ; water will always make a way for itself. The damage to those water mills, I should say, would be so immaterial that it would not be desirable to interfere with the large manufacturing interests of the country. I look at it from a much broader point of view ; there is the question of health to be considered. Our rivers, no doubt, are becoming so polluted, and the stench is so bad from many of them from time to time in the summer months, that it is imperative that something should be done to get rid of the nuisance to a certain extent at any rate.

10,545. (*Mr. Harrison.*) You stated just now that you use about 200 or 300 tons of dyewoods ?—There will be 700 or 800 tons, probably nearly 1,000 tons of material which is insoluble.

10,546. You mean 1,000 tons per annum ?—Yes, of material that would float away, or which in substance would pass along with the water. Then there may be possibly 500 or 600 tons more of other materials consisting merely of colouring matter and acids.

10,547. That is the quantity you use, dyeing upwards of one-tenth of the whole of the stuff goods of this district ?—Yes, I think so.

10,548. So that 10 times the 700 tons, or 7,000 tons a year would be the utmost quantity ?—Ten times the 1,000 tons.

10,549. That is 10,000 tons is at present the largest quantity of insoluble materials to be dealt with ?—Yes, so far as piece-dyeing is concerned.

10,550. Can you furnish us with any data as to wool-dyeing ?—It is very difficult to give particulars as to that. There is nothing like the same amount of material used for cotton warp and wool-dyeing in the district as there is of material used for piece-dyeing.

10,551. How much less would it be ?—It is mere guess, but you may take the one at 10,000 tons and the other at 5,000 or 6,000 tons.

10,552. The two together would be 15,000 tons a year ?—Yes, from that to 20,000 tons would represent the whole of the solid material from the dyeworks of the district.

10,553. Does that quantity bear any comparison with the weight of ashes that are removed from the manufactories ?—No ; the weight of ashes that are removed is very much larger than that, no doubt.

10,554. If I understood you rightly you stated that dyers would not object so much to separating the solid matter from the liquid as to being obliged to remove it ?—I think that that is the greater difficulty of the two. You can scarcely compare the two cases ; as to the ashes there is generally a use for them, they are used in various ways, for instance, to repair the roads and for making footpaths, and now they are very largely used to mix with mortar. There is no such purpose to which dyeware refuse can be applied. You have really to get the refuse away to some place where it can be permanently thrown aside.

10,555. If you had to pay for the removal of the 1,000 tons of spent dyewoods and refuse that you make in a year what would the expenditure be likely to be per ton ?—You have to obtain a piece of ground to place them on. These things become very large heaps. I cannot venture an opinion as to the question.

10,556. At Wakefield we found that they are put to the expense of at least 1*s.* a ton to remove their ashes. Are you aware of that ?—If they remove them to a short distance, 1*s.* per ton is soon spent.

10,557. No, they put them into boats, and the boats carry them to some point, and then they barrow them out ?—At Wakefield they have that advantage in getting rid of the ashes which we have not here.

10,558. There is wheeling into the boat, loading and wheeling out again, and it is a considerable expense to which they are put ?—Yes.

10,559. You gave us the number of pieces which you considered were dyed in this neighbourhood. Could you furnish us with the same information as to the quantity dyed in 1841, 1851, and 1861, in order to show what the gradual increase has been ?—The increase has not been very gradual, but very rapid. I should say, in round numbers, that the piece trade of the district has doubled itself from 1841 to 1865.

10,560. If we take the 7,000,000 pieces which are made at present, it would be 3,000,000 in 1855 and 1856, and 1,500,000 in 1845 and 1846 ?—It is only a very rough guess. The difference between the class of goods which are made now and those which were made 20 years ago is so great that a comparison of them would give a fallacious view of the trade.

10,561. Would the weights differ ?—Yes, and the character of the goods altogether. 20 years ago the great mass of the goods were made of wool, whereas now they are made of mixed cotton and wool. These

BRADFORD.

H. W. Ripley, Esq.

15 Nov. 1866.

have increased very much in quality, but the weights have decreased; the conditions are so completely different that you can only take the money value.

10,562. Can you state what the money value would be?—I think that in money value you get something like correct data. I should say roughly, in reference to piece goods, that the money value has doubled itself twice at least. With regard to yarns the increase has been very much greater than that. The export trade of this district in yarns in 1844 was 1,500,000*l.* and last year it was nearly 6,000,000*l.*, that really comes to the same result.

10,563. In estimating the number of pieces which are prepared in the district, did you take into account the pieces that are sent to Leeds to be dyed?—Yes; they are only a very limited quantity as compared with those that are dyed in Bradford. 20 or 30 years ago the stuff-trade so far as regards the merchant which is now carried on exclusively here was carried on in Leeds. At that time a merchant being there had his goods dyed there. The stuff-trade has entirely ceased to be carried on in Leeds. Every merchant, both in the home and the foreign trade, who is engaged in business to any extent whatever, is located here, and the accidental fact that goods are taken to Leeds to be dyed now in limited quantities arises in this way, that dyers have long existed there, and so long as they continue to manage their business well and have a fair supply of water (which is a more material question than the question of carriage between Bradford and Leeds), those parties will probably continue there as dyers.

10,564. Do you attribute in a great measure the removal of the dyeing trade from Leeds to Bradford to the circumstance of your having a superior quality of water, and water in abundance?—No, I attribute it simply to the fact of the merchants being here I have no doubt that if there had been plenty of water here at a cheap rate, instead of not more than one half of the goods which are used here by the merchants being dyed on the spot, nine-tenths of them would be dyed here. At the present time there is no supply of water except at a higher rate than it can be obtained in places outside the town; at Leeds, for instance, and Wakefield.

10,565. You gave us just now the value of the goods exported from this neighbourhood?—Yes.

10,566. Can you give us any estimate of the value of the raw material used in carrying on that trade?—Only very approximately. If you take the quantity of wool required for the 6,500,000 or 7,000,000 pieces that are made here at an average weight of 6 lbs. of raw wool, that gives 42,000,000 lbs. of raw wool; you may add probably 2,000,000 or 3,000,000 lbs. for the class of goods which are heavier than the general average, making altogether from 40,000,000 to 45,000,000 lbs. The export of yarn trade, representing a value of about 5,500,000*l.*, will consume from 35,000,000 to 40,000,000 lbs. of wool, according as the wool used is wool in the grease or washed wool. The trade from this country in yarns to Scotland, Norwich, Lancashire, and other places, is very difficult to calculate, and it is only a guess; the other may be taken on very sound data at about from 25,000,000 to 30,000,000 lbs. of wool. That would bring the consumption of wool, in round numbers, to from 100,000,000 to 120,000,000 lbs. I do not think it can be brought to any more definite calculation. It is about, say, 110,000,000 lbs. of wool.

10,567. At what price would you put the wool?—The price of the wool has ranged very high indeed during the past two years. It is somewhat lower now, and may remain so, but if you take it at 2*s.* a pound you would get about 11,000,000*l.* as the value of the raw material.

10,568. With regard to the materials for dyeing, is any shoddy used in the stuff district?—No, not in this district.

10,569. Besides the wool you have the dyewoods and other materials which are imported, what is the value of them?—The other great article of consumption is cotton warps.

10,570. What would the cost of the raw material be?—It is not in a state of raw material; the cotton is in a state of warp when it is brought here. The value is estimated to be about 4,000,000*l.* I should have said between 3,000,000*l.* and 4,000,000*l.* per annum.

10,571. The materials used for carrying on the processes of dyeing, I mean the dyewoods and things of that kind, what value would they represent, taking the whole district?—The value of the soap and dye wares and oil (although it is the merest guess), I should think would be under 500,000*l.*

10,572. The difference between all these items added together, and the 24,000,000*l.* or 25,000,000*l.* which you have given as the value of the goods produced, would represent the industry of the neighbourhood?—Yes.

10,573. Can you tell us what proportion of British and foreign wools you use in this neighbourhood?—That is a very difficult question to answer. The greater proportion of it is English wool.

10,574. Have you any means of judging of the weight of British wool produced in the country now?—Yes; we have happily got some very good data, the recent statistical returns to the Board of Trade, giving us the number of sheep in the country.

10,575. What is your calculation of the annual produce in British wools?—150,000,000 or 160,000,000 lbs., probably about 140,000,000 lbs. of washed wool are about the annual produce.

10,576. Can you give us the weight of wool imported in different years for some years past into England?—The weight of wool imported, according to the last completed returns of the Board of Trade, was 238,000,000 lbs., of which about 56,000,000 lbs. were exported, leaving 182,000,000 lbs. kept for home consumption.

10,577. Was that last year?—No, the year before.

10,578. Can you give us the weight in any periods previous to 1864?—No.

10,579. Taking both the worsted and the woollen trade carried on upon the Aire and Calder, can you give us a close approximation to the quantity of wool manufactured within those basins?—No, I cannot. I should prefer confining my answers to the worsted districts.

10,580. I wish to ascertain what the importance of your woollen trade is in the West Riding as compared with the woollen trade of the whole country. Is it not very large?—Yes; it comprises the greater proportion of it no doubt.

10,581. You have given us the volume of water that you pump respectively from old colliery workings and from the flagstone below?—Yes.

10,582. From the one source you pump 1,000,000 gallons per day, and from the other from 500,000 to 600,000 gallons a day. From what depths do you pump those quantities?—The old colliery workings immediately under my lands at Bowling are from 120 to 130 feet deep.

10,583. Varying from a maximum to a minimum level?—There is an outflowing sough which runs into Bowling beck, that is when the colliery workings are full; they do not vary more than 10 or 12 feet in depth.

10,584. From what depth do you pump the other water?—The flagstone is about 50 yards below the colliery workings.

10,585. What expense do you incur in pumping that water?—It is so mixed up with the operations which are carried on that it is quite impossible to give the expense separately.

10,586. Do you cleanse the wool as well as dye it?—The pieces we do.

10,587. What do you use to clean them with?—Soap.

10,588. What becomes of the suds?—The nature

of the goods that pass through our hands is such that it really leaves no suds, it is not like scouring wool, where you have a great mass of grease, and where the liquid is thick and can be operated upon; the water which passes away from the troughs or vessels in which our pieces are scoured is considered as worth less. I mean that it does not contain any large quantity of grease.

10,589. Is it passed away into the brook?—Yes; it passes away with the ordinary dye waters.

10,590. Have you assisted in erecting any works to collect the soapsuds from other manufactories?—Yes; I let some old premises that were conveniently located to collect by pipes the soapsuds from many of the manufactories, and I have now made a fresh arrangement with Messrs. Le Page, of Wakefield, to let some new premises; they have just completed their arrangements for connecting a number of mills, where wool washing operations go on with their grease works. All the foul and greasy water which comes from the wool washing, after having been operated upon, and the grease and filth extracted from it, passes away into a drain, apparently almost as pure water.

10,591. From your knowledge of the operation, do you think that the process can be carried on so that the water shall be passed away from the soapsud works in a clear and tolerably pure condition?—Yes; from having watched the operations at these particular works and at the old works for several years, I have no doubt upon the point.

10,592. Do you think it would be any hardship if the Government required that no soapsuds should be passed into the rivers or any running streams before such soapsuds were purified?—Practically, I apprehend that legislation would be useless on that point, because manufacturers, wherever they have the opportunity, are using the means which are now at their disposal to obtain money for their soapsuds.

10,593. Are you aware that up to this time not one-half of the soapsuds have been reclaimed?—I can quite believe it, because in matters of this kind operations are so slow.

10,594. But as manufacturers have a pecuniary interest in carrying out the system a little extra pressure would not be injurious, would it?—It is not altogether that, but the time and circumstances which the parties have not the least within their control; for instance, until within the last three months two or three of my tenants could not possibly have used these premises, they had no means of getting access to them until just now, although they were wishful to do it. You must give time in all these cases to effect changes, however desirable they may be. I can now give you the imports or quantities of foreign wool kept for home consumption during the three decennial periods I have mentioned; in round numbers, in 1844 it was 64,000,000 lbs.

10,595. What was the raw wool worth in 1844?—That will require a little consideration. The weight in 1854 was 82,000,000 lbs., and in 1864 it was 182,000,000 lbs.

10,596. So that it has very nearly trebled since 1844?—Yes.

10,597. Do you suppose that there has been any great increase in the weight?—Some time ago I stated that I thought the trade had twice doubled itself in the past 20 years, of which I have the proof here. The exports in 1844 were 9,000,000*l.*, and the exports in 1864 were 24,000,000*l.*; those are only exports.

10,598. Can you put in any papers containing these statistics?—Yes; whatever may be applicable shall be handed in.

10,599. Do you think that there is any great difference in the weight of British wool which is produced in the country now and that which was produced in 1844?—We have no data by which to judge of the quantity, except this fact. The prosperity of the district since the panic of 1858 has been almost unprecedented, uniform and continuous to an extent that I never remember before. One result of that was that commencing in 1861, and going on to 1864 it was found that the stock of English wool was very gradually but evidently decreasing in the country; in some districts, I know that in 1863 and 1864 there was none, it had all been sold; we know that to be a fact. The stock of English wool which is now held in the farmers' hands is a very considerable amount. The consumption has been going on more rapidly than ever, and I think I need give you no other proof than this, that the increase in the number of sheep has been very great during the last seven years.

10,600. I kept for some years a Southdown flock, some 12 or 15 years ago. I found that the short Southdown wool sold the best, but of late years I have found that it was better to have cross-bred sheep, or long-wool sheep, as there was a greater demand for the wool, and it brought a better price?—That illustrates the fact which I named to you in reference to the competition between this country and France. Many years ago we had a considerable trade in fine goods that were sent to France, and also to America, and were also used for the home trade, all made from the Southdown and similar wools. Now not only do the French supply America and other countries where we sent a class of fine goods, but there is not a piece made in all this district to compete with what are called French merinoes. The increase of Australian wool has tended to lower the price of the Southdown wool.

10,601. The tendency is to increase the long-wool sheep of this country, and consequently the whole produce of Great Britain?—The great want of this district, and what we encourage farmers to produce is long bright-haired wool.

10,602. In the weight of the foreign wool which you mentioned, did you include the Alpaca and Mohair?—Yes.

10,603. (*Chairman.*) Has the Scotch trade increased as rapidly as the Yorkshire trade in light goods, such as those made in Galashiels?—That is not a trade to compare with ours; it is more a woollen trade. Glasgow and Paisley are the two principal places where goods of a similar character to ours are made.

10,604. Has that trade increased as fast as yours?—I think not; it has increased very largely, no doubt. The yarns for that trade are principally sent from this district.

10,605. Did the American war interfere with the Yorkshire trade either to retard or promote it?—For a few months, at the commencement of the American war, there was a general fear that we should have a panic in consequence of the absence of the American trade, but the result was that after a few months had passed the American trade was perfectly healthy and continued so during the whole period of the American war. I believe the American merchants never made so much money in their lives as they did during that war. The Bradford trade was never more prosperous in consequence of the steady continuance of that trade.

10,606. What is the amount of duty charged upon English goods that are conveyed to America now from Bradford?—It is very heavy; on an average 50 per cent. nearly.

10,607. Has that duty been put upon the goods since the cessation of the war, or was it put on during its progress?—It was gradually increased during the war; there has been no increase since the war, I think; it was increased up to 50 per cent.

10,608. And remains at that amount now?—Yes; but notwithstanding that the Americans have taken, speaking generally, larger quantities of our Bradford goods.

10,609. Is there a similar duty upon goods sent from France?—I believe French goods pay the same duty, it is a general tariff.

10,610. What weight of coal do you burn per annum?—Over 20,000 tons.

10,611. Have you considered the question of smoke prevention in burning your coal?—I have been

BRADFORD.

H. W. Ripley, Esq.

15 Nov. 1866.

turning my attention to that subject latterly, and I think the time has come when we have had sufficient experience to base some general plan for the consumption of smoke, some plan applicable to all.

10,612. Have you tried any specific plan?—From time to time during the past 20 years I have seen tried several plans, many.

10,613. Did you ever see a plan tried that appeared to you to accomplish the object?—I think I have seen plans that appeared to answer, the parties apparently have been satisfied with them, but ultimately they have fallen into disuse, or a difficulty has arisen. I think we have sufficient data now on which to base some general action as to smoke consumption, and I ventured to express an opinion some weeks ago, that we should see a very great change in Bradford in two or three years in that particular.

10,614. Is a bright or clear atmosphere an advantage to the Bradford trade?—No doubt of it.

10,615. Do the soots and smoke which pervade the town now injuriously affect the goods?—I have no doubt that very great injury and great loss are sustained in consequence of the sooty state of the atmosphere.

10,616. Have you ever put in operation any kind of patent for preventing smoke?—Yes, and hitherto they have all been laid aside. It is almost premature to speak of them, but we have two plans, not speculative plans, which I believe will be applicable under different circumstances, and which are to be worked out in a few weeks. I have the greatest faith in them. I believe that one or the other, according to circumstances, will certainly be a smoke cure, and without doing injury to the boilers, which is really a great and vital question, and which has hitherto been the great difficulty.

10,617. Has it occurred to you in working your boilers that instead of dealing with the patentee you had better deal with your own fireman?—Yes; that is all very well, and in some cases it can be worked out by the fireman, if you have an intelligent man, and there is plenty of boiler space, that is to say, where he has not to force his fire; but no man can burn the smoke where he is compelled to raise a given quantity of steam in a given time, if his boiler space is not more than equal to the raising of that steam, or without pressing upon his fire after he has thrown coal upon it, and stirring it up to raise an extra quantity of steam.

10,618. Are you quite sure of that?—I think that there can be no question about it. If you should adopt some system of smoke burning, which is beyond the control of the fireman (and I believe that we shall never get to smoke burning thoroughly satisfactory until we do use such means) by which he cannot force his fires beyond the power of the apparatus with which he is working, and consequently, if that apparatus is working rightly, and has once burnt its smoke, it must continue to do so.

10,619. Smoke prevention, in fact the combustion of fuel, is to a great degree a chemical operation, is it not?—I will not venture to say. It is perhaps partly a chemical operation, and partly a mechanical one.

10,620. It is the conversion of a solid into a gas?—Yes.

10,621. The smoke consists of the finest solid particles of the fuel?—No doubt.

10,622. That, we say, is visible smoke?—Yes.

10,623. There would be the same amount of material passing up the chimney if smoke were prevented, but it would be invisible?—I am not sure about that. I should say that there would not be the same amount of material passing up the chimney, not the same material substance at all events.

10,624. If you pass 10 tons of coal into a furnace, and if during its combustion you continue in one case to produce dense black smoke, and if in the other case you consume the whole of the 10 tons without any but parliamentary smoke (and by parliamentary smoke I mean smoke which can be seen through), would not the same weight of coal in both cases pass up the chimney; would not the same products of the coal pass up the chimney?—No; in the one case you pass up the gases which have been produced by the perfect consumption of the coal, and in the other case you pass up the particles of coal itself.

10,625. But still, weight for weight, the same 10 tons are passed?—On the same principle you might say that the whole weight of the coal which you throw into the fire goes up the chimney.

10,626. If the residuum of the ashes is one ton in each case, there is no other means of escape for the whole substance of the coal either as smoke or as a gas, except up the chimney, is there?—Of course not.

10,627. Then you pass the same weight in both cases?—I am not sure about that, whether the weight of the gas is equal to the weight of the coal.

10,628. There is no such thing as annihilation,—combustion is the conversion of one thing into another, in the case of coal, a solid into a gas, less or more transparent as the combustion or conversion is less or more perfect?—It is.

10,629. (*Mr. Harrison.*) It must all go up the chimney in one shape or another?—Yes, it goes up the chimney in the shape of smoke, soot, or gas.

10,630. (*Chairman.*) You say that if you have to force your boiler to make steam you must make smoke?—Yes.

10,631. Of course the fact of making smoke shows that you retard the generation of steam, and it arises from the method of firing. A man now, in order to force his boiler, and to save himself trouble opens his fire-hole door, and sends in say two dozen shovelfulls of fuel right up to the bridge, as far as he can scatter it in; he covers the whole living fire with a coating of black cold fuel which so chills his fire as to prevent the combination of the gases at a sufficient temperature to consume the carbon which is roasted off from the coal?—It depends upon the man. I have seen men do it in both ways.

10,632. If you make black smoke you may rest satisfied that your fireman is sending in coals over living fire as far as he can throw them?—Then he must pick his bars in order to make the coals consume more rapidly.

10,633. If the fireman pressed the fire from the front and threw the coals on the dead plate in front, then the carbon would slowly roast out?—That, no doubt, is the sound theory of smoke burning.

10,634. I would undertake to fire the worst set of boilers, and the heaviest worked set of boilers in Bradford, and to produce the same amount of steam, and not to send anything up the chimney but parliamentary smoke?—I would select the coal for you, coal producing a very small amount of carbon.

10,635. It shall be the same coal as that which those boilers are ordinarily worked with?—If that is the case we have something to learn, and it is high time that we learned it.

10,636. (*Mr. Harrison.*) Can you state what weight of coal is consumed in the worsted districts?—I could not, without a good deal of calculation, give any approximate idea of the quantity of coal consumed here.

10,637. (*Chairman.*) I think that the School of Mines publish yearly the entire product of our coal mines in this country?—Yes.

10,638. And there is a coal commission which is about to sit upon the subject?—Yes.

10,639. (*Mr. Harrison.*) You have the Board of Trade returns?—I do not think that they go back beyond 1844.

The witness withdrew.

Mr. George Edward Mumford (Bradford) examined.

10,640. (*Chairman.*) What do you wish to state to the Commissioners?—I wish to make some explanation with reference to the Bradford Canal Company. I am solicitor to the Bradford Canal Company.

10,641. What are the points which you wish to explain?—It is of great importance to my clients that the explanation should be made, and that is the reason why I tender it. It has appeared from the evidence which has been given that the injunction is against the canal as a nuisance, and that it is the canal company's fault that the nuisance exists. Now the injunction really is against taking the water of the Bradford beck so as to create a nuisance, not that we are not entitled to the water of the beck, but simply that we are not to take it now that it is in such a state as to create a nuisance. It has been stated that we have no statutory powers to take the water of the beck. It is rather of importance that it should be explained that we have full statutory powers to take the water of the beck; we are entitled to it. I shall be able to hand in documents to you which prove that fact conclusively and beyond doubt. Three out of the four judges stated in their judgment that we were entitled so to take the beck water. The decision was simply on the ground that the water of the beck was in such an offensive state as to create a nuisance, and that therefore we were for the present debarred from taking it. If the beck is ever rendered pure and clean, we shall be entitled to our supply from it as heretofore. I think that I should give to the Commissioners a copy of the Bradford Canal Act. I have marked the parts in which we are authorized to take, "all such streams and watercourses as shall be found in making the said cut or canal." There are other provisions, but those are the special provisions. I will give to the Commissioners a tracing of the plan which was deposited at the time of applying for that Act of Parliament, which shows the intended line of canal; it shows the Bradford beck, and it shows the two points of intersection. I can put in a copy of the shorthand writer's notes of the judgment in the Court of Queen's Bench. The other judges allude to the point, but Mr. Justice Shee specifically says, "On "looking to the Acts of Parliament it appears that "the company were authorized to take water for the "purposes of the canal from the beck, which at the "time the legislature authorized the taking of the "water was sufficiently pure," &c. Then I believe that the affidavit of Mr. Leather was handed in yesterday. That affidavit was of course simply made for the plaintiffs, and was an ex parte statement. I will hand in a copy of the evidence on both sides. I will not trouble you to read it; it is simply for your use if you wish to refer to it. You will see that on our side we consulted equally eminent engineers; we analyzed Mr. Leather's suggestions, and the result was that we found that they were entirely impracticable; they could not be carried out; the Bradford Canal Company would have been happy to do so if it had been possible. I will also give you a copy of the answer of the defendants to the information which was filed in the Court of Chancery, which will show you the grounds of defence which they had, and the position of the canal company. The only other reference which I have to make to this part of the case is to a statement which I observe has been made by one of the members of the corporation who has been examined, Mr. Godwin. Mr. Harrison says, "Therefore the canal company have just ground of complaint." The newspaper report states, "Mr. "Godwin said that with regard to that point it was "difficult to speak, but he thought the canal com-"pany were bound to obtain a good supply" of water. Now if, as is very common here, the word of the corporation is taken as law, that statement in itself would be detrimental to us. The Bradford Canal Company, in their answer, set out the 25th section of the Bradford Improvement Act, 1850, to which I would specially call your attention. By that enactment the corporation are empowered to cleanse and otherwise deal with the brooks and streams in the borough as therein mentioned; and the Bradford Canal Company contended that it was the duty of the corporation, and they do contend still that it is the duty of the corporation, either to take means for preventing pollution coming down as far as the place where the water is taken into the Bradford canal, or to supply the canal company with fresh water at the expense of the corporation. As we contend, the corporation are the conservators of the town, and they have neglected the powers which they could have put in force; the town, therefore, have occasioned the nuisance complained of, and the loss and damage which the canal company will suffer by being shut up as they are substantially; the town should either have taken means to prevent the stream being in such a foul state, or they should have furnished us with a pure supply of water, or, of course, in the alternative, have paid us compensation for the damages which we have sustained.

(*Mr. McGowen.*) Of course the Commissioners do not expect us to acquiesce in that view. Of course, you gentlemen are not sitting here to inquire into matters of this description. If this were the proper time I should meet these statements.

(*Mr. Mumford.*) I should not have brought this matter before your attention at all if I had not been compelled to do so by the remarks of previous witnesses. It was not my intention to tender evidence, or in any way to take up your time.

(*Chairman.*) In looking over the shorthand writer's notes of the proceedings here, if we find that we cannot use the evidence which we have taken without prejudicing you in a legal point of view we will strike out the notes on both sides.

(*Mr. Mumford.*) My position is rather critical at this time, inasmuch as to-day application is to be made for an extension of time for the injunction. I believe that it will be granted, but if it is not granted the canal will have to be closed to-morrow; that will be a great loss and detriment to the town. We have given notice of our intention to apply to Parliament for powers to dispose of the canal, and we shall apply to Parliament for such powers. When we come before Parliament it will be necessary that we should go there with the good will of the inhabitants of Bradford, and if statements are made before you which are calculated to do us injury, I think that it is my duty to set them right.

10,642. (*Professor Way.*) You know that the evidence taken here has no legal value?—Not at all.

10,643. And that we do not express an opinion upon it?—Certainly. I merely wish my observations to have the same publicity as has been given to the other statements which have been made. Your object, I believe, is to improve the condition of the streams, and I should like to show you the effect which this intended application to Parliament will have, and the additional powers and privileges which it will give the corporation. This is a plan of the canal company's property; this is Bradford where the end joins, and this (*pointing out the same*) is the part where the nuisance complained of exists. The canal runs down to join the Leeds and Liverpool canal at Shipley. This part (*pointing out the same*) is now entirely built over by houses, and is town; the town is as it were squeezed down on both sides of the canal, and would be squeezed beyond it, but for the water and the canal company's property. The Leeds and Liverpool Canal Company have made a proposal to take the canal, and to keep it open. Undoubtedly it would be a great advantage to the town that it should be kept open, inasmuch as it is the only means of opposition to the railway company, and power would be placed in the railway company's hands if it were not kept open. But this part of the canal property (*pointing out the same*), running into the town as it does, and being the chief source of the nuisance, the canal company consider it essential that it should be closed. The large portion of land coloured green here would give great facilities for making docks and wharves, and so on, and the canal company have proposed to let the Leeds and Liverpool

BRADFORD.

Mr. G. E. Mumford.

15 Nov. 1866.

Company have so much of the canal up to this part (*pointing out the same*), but that the canal should stop here (*pointing to the plan*).

10,644. (*Chairman.*) That would shut up how much of the canal?—About 500 yards. The effect of that will be that the taking of water into the canal from the Bradford beck will be done away with. The Act will give powers to the corporation to deal entirely with that portion of the beck, to arch it over, or to do anything which they wish with it. I am not in the secrets of the corporation, but it is perfectly obvious that an improvement is very much wanted to make streets across that portion of the town where they cannot come now, and to make a road down there, and to build (as you heard the other day was very much wanted) a town hall, a post office, and to make other improvements, and the plan will be equally advantageous to the public by keeping the canal open for that distance in competition with the railway. I simply put this before you to show that the canal company have done all that they can to keep open the canal for the public benefit, that it is not their fault that the canal is closed, and that they are still anxious to make the canal beneficial to the public.

10,645. Will the land now covered with water be given to the corporation or sold to them?—The canal company have incurred a great deal of expense and I do not think that they are in a condition to give much, but must rather seek to recoup themselves for the expenditure. But I think that the town clerk, if asked for his opinion, will say that that would be a great improvement to the town.

10,646. You will sell the land to them cheap?—We will sell it to them at a reasonable and fair price.

10,647. (*Mr. Harrison.*) Had the canal company under their Act power to make reservoirs for the supply of the canal?—The canal company had power to make reservoirs under their Act. I am glad that you have asked the question, because a great deal has been rested upon the fact that they had not made reservoirs. It was not necessary. The power to make reservoirs was simply a general power included in the power to make the canal. In making the canal the company raised the water by means of a dam for which flood gates were afterwards substituted, and they found that they had sufficient water to work the canal without making reservoirs.

10,648. As the canal was polluted, did the canal company take any steps to try and prevent that pollution?—The pollution of the water, as I am informed, has been so gradual that it was not possible to take any steps, besides which the fact of the pollution being occasioned by so many people rendered any attempt to prevent it perfectly impracticable.

10,649. There is a mill, I observe, upon the plan between Bradford and the river Aire?—Yes; Frizinghall mill.

10,650. Was that mill in existence when the canal was formed?—That mill was purchased by the canal company and is now vested in the canal company.

10,651. Do you know what volume of water you use daily upon the canal for passing boats down it?—About 3,000,000 gallons a day. I have just received the following telegram from my agent, "Order made "without calling for reply. Amphlett stopped." We moved for six months further time, and I take it to be that we have six months further time, which will enable us to bring in our bill before Parliament and to make the necessary preparation.

10,652. Will the defending of the action be a costly affair?—A great expense has been incurred. It has been a very costly affair.

10,653. What may it have cost?—The costs on both sides will spoil 5,000*l.*, I should think.

10,654. (*Chairman.*) Is there anything which you would wish to add?—I should like to have one witness called for the canal company, namely, the lessee of the canal, who will tell you the state of the water which comes down the beck and the means which have been taken to purify it.

The witness withdrew.

Mr. Jeremiah Crowther (Bradford) examined.

Mr. J. Crowther.

10,655. (*Chairman.*) What are you?—I am lessee of the Bradford canal in conjunction with another person named Dixon.

10,656. How long have you known the Bradford canal?—I should think for 30 years.

10,657. In what state is the water now as compared with what it was when you first knew it?—It is very much worse.

10,658. Where do you get your supply of water from to feed the canal?—From the Bradford beck.

10,659. In what state is the Bradford beck as compared with what it was 30 years ago?—I cannot give you any idea of it, because I was not resident in the town to notice the beck.

10,660. Is the beck fouler than it was when you first knew it?—A great deal.

10,661. At what time of the year is the water in your canal in the worst state?—In summer time.

10,662. Has it a disagreeable smell then?—A disagreeable smell.

10,663. Does it affect you at all?—Not at all.

10,664. Does it affect the workmen who work upon it?—Not at all.

10,665. Does it affect the persons who reside upon it?—I have never heard any complaint from the cottagers who reside upon the sides of the canal.

10,666. Or the persons walking along it?—I have heard them complain very much.

10,667. To what points do you wish to speak as to the Bradford beck, or as to the mode of purifying it?—We have taken every step possible to keep out the heavy filth; we have put down grates.

10,668. And that does not do it?—That does not do it.

10,669. Do you dredge the canal?—We flush the top length every fortnight into the beck.

10,670. Then you send back again and on downwards what comes from above?—Yes.

10,671. Then anysolid portion which you receive you give back again into the beck so far as you can?—Yes.

10,672. Is any objection made to that?—I have not heard of any.

10,673. Do you ever dredge the canal?—We did so some 12 or 13 years back, and we then got out a great deal of dirt.

10,674. But you have not done it since?—No.

10,675. Do your boats ever ground upon the sludge at the bottom of the canal?—Yes.

10,676. And that makes it difficult to carry on your trade?—Sometimes it does.

10,677. Have you at all complained of that state of things?—Yes; the only way in which we can get quit of the dirt is by flushing.

10,678. You could dredge and take away every pound of dirt if you thought proper to do so?—Undoubtedly.

10,679. It would be far more costly?—Yes. At times great weights come down, as on a Saturday when they flush or clean out the dyehouses above, and that stops our work. If we find out when the stuff is coming down we shut down the feeding cloughs and stop it.

10,680. Has it ever occurred to you that it would be advisable to get pure water from some other source for carrying on the canal trade?—Decidedly.

10,681. Have you ever tried to do it?—No; but application has been made to the corporation.

10,682. Have you asked them to give you clean water instead of dirty water?—Yes; they have been asked what they would charge for it.

10,683. How many locks of water do you use in the 24 hours, in and out at that part?—About 32.

10,684. What length, and what depth and width are your locks?—They vary a little, they are about 70 feet,

10,685. Do you know how much water it takes to pass a boat?—Yes; I think about 61,000 gallons.

10,686. Have you any side ponds?—Yes, at various places.

10,687. Have you side ponds upon your locks to save half the water; did you ever see a lock which had a side pond?—I do not understand you.

10,688. There is a method by which you can use a lock and only waste half the water?—We have not that arrangement.

10,689. (*Mr. Harrison.*) You say that about 32 locks full in a day pass down?—Yes.

10,690. And that there are 61,000 gallons to a lock?—Yes.

10,691. That makes nearly 2,000,000 gallons a day?—Yes.

10,692. Mr. Mumford gave us 2,500,000 gallons?—There is the waste.

10,693. Say 500,000 gallons for waste?—Yes; the water is drawn over the byewash.

10,693*a*. If you got 2,000,000 gallons a day from the water company, what price could you afford to give them for it?—We could not afford to buy it.

10,694. (*Mr. Mumford.*) It would come to about 10,000*l*. a year.

10,695. (*Chairman to Mr. Crowther.*) Of what size are those locks?—They vary.

(*Mr. Mumford.*) They are 73 feet, by 15 by 9.

10,696. (*Mr. Harrison to Mr. Crowther.*) That is a little more than 60,000 gallons?—Yes.

10,697. You would have to deduct something for the draught of the boat?—Yes.

10,698. (*Chairman.*) Have you at all contemplated purifying the beck water?—It has been named.

10,699. Has any scheme presented itself to you for purifying it?—Not to carry out the thing. We could commence, but there would be such a weight of material and dirt that I do not know what we could do with it.

10,700. I believe that you have heard that your company propose filling up about 500 yards of the canal, and doing away with it?—Yes.

10,701. Where are you to get the clean water for working the other portion?—The only plan which I can see which is available would be to get water from the Leeds and Liverpool canal.

10,702. In that case you think that you could work the remaining portion of the canal without admitting the Bradford beck water at all?—Decidedly.

10,703. And then you would have a comparatively clean canal?—Yes.

10,704. (*Mr. Harrison.*) Should you have to pump water from the Leeds and Liverpool canal?—There are two projects in view—one by gravitation, and the other by pumping.

10,705. (*Mr. Mumford.*) The Leeds and Liverpool Canal Company have made a proposal to rent the whole of the Bradford canal. They have consulted Mr. Beardmore, and they say that they must go to an expense of 9,000*l*. or 10,000*l*. in putting down pumping engines to pump water from the Leeds and Liverpool canal into the top lock, at the Bradford end, from Shipley, and that the expense would be from 800*l*. to 900*l*. per annum to maintain those stations. They requested to have a lease for 21 years, and at the end of that 21 years we were asked to take their plant and engines, but we were not told how we were to take the water. Of course it was useless to suppose that we could accept that offer. We, on the other hand, suggested that it would be equally beneficial to them and to the town to have the land to the extent which I have shown you, and there would also be this advantage, that by taking off that length the water would come simply by gravitation to that point from Bingley. You will see from the affidavits of the engineers whom we have consulted that it is perfectly impossible to get pure water from any other source than from the Leeds and Liverpool canal.

10,705*a*. If steps were taken to purify the Bradford beck you would then have power, as you have now, to take that water?—Yes.

10,706. What would be the result if you allowed the proposition of the Court of Chancery to be carried out, and if your canal was stopped up for a certain time until the streams were purified, and if the water was then resumed by the canal?—Our position would be hopeless; we should have lost the traffic; it would have gone on to the railway. Bradford would be at the disadvantage of losing the canal, and the railway company could charge what they pleased.

10,707. (*Professor Way.*) You have a right to water, but not to impure water?—Yes.

10,708. And the canal for the moment is the settling tank of the beck?—Yes. In our evidence we established satisfactorily that the beck is at least as bad if not worse than the canal, and that great alterations are wanted in the beck to improve it. The effect of stopping the canal will be to turn all this water into the beck. There are large settling ponds and places in the beck where the mud will rest, and when the canal is closed the beck will be in place of the canal, and will be in fact worse than it.

The witness withdrew.

Mr. Samuel Smith (Bradford) further examined.

Mr. S. Smith.

10,709. (*Chairman.*) I think that you have some statistics which you wish to put in?—Yes. I was asked the other day with regard to some things as to which I was not in a position to state, and I had to make some inquiry from our books.

10,710. The statistics as to the refuse sent from the works and as to the acids?—Yes.

10,711. And as to the quantities of dyeing liquids?—Yes. Taking the first six months of the present year as our data, the amount of acid which we use per annum is about 300 tons liquid.

10,712. That is at your own works?—Yes; there are various acids, for instance, sulphuric and nitrate and muriatic. We possibly use about half that weight of other acids, which are crystalized, such as alum and other things which would be considered acid. Then as to an estimate of the dyeing liquors which we turn into our drain in the course of the day, I find that the quantity of liquors made for dyeing goods with varies from 40,000 to 60,000 gallons per day, and no more. All the other water which we use is used either for scouring, or for washing purposes after dyeing. In fact, by far the greater portion of the water which we use is used for washing after dyeing. A great deal of that water passes into the drain colourless, and to all appearance clear. Then I was asked respecting the quantity of water which we drew from the corporation. I see that, judging by the first nine months of this year, our consumption this year will be equal to 40,000,000 gallons drawn from the corporation source, besides what we raise ourselves. Then a question was put as to the quantity of solid matter which we consumed. I have made an approximate calculation that the dyeing materials which are insoluble are chiefly vegetable, and we do not consume 1½ tons per day upon the average. That consists of rasped woods and various other matters which we use in dyeing. Cochineal and indigo and lac dye are solid to a certain extent, but still they do not occasion any trouble in the water.

10,713. (*Professor Way.*) What is the condition of the dye when it is fixed in the cloth, is it in a soluble or insoluble state?—To prepare wool to receive colours, wool being a porous article, the colours require first the application of a mordant, and that mordant enables the colours to be fixed upon the wool or the cotton.

10,714. Take this piece of cloth; it has been dyed?—Yes.

10,715. Can I wash out the dye?—No.

10,716. It is not in a soluble condition?—No.

10,717. Then in the act of dyeing this cloth, that which was previously soluble became insoluble?—No.

BRADFORD.

Mr. S. Smith.

15 Nov. 1866.

10,718. How did the dye get into the cloth if it was not soluble in the first instance?—The dye must be in solution in the first instance, and the wool must be in a state to absorb the colour.

10,719. If that be so, what is the refuse like in the dye vats when it is turned out; is it all in solution, or is some of it in suspension?—It depends upon circumstances; we have to put in solid matter from which to extract the colour, and some of it remains still soluble after dyeing.

10,720. If you put in a perfectly liquid matter, would you not have a soluble matter in your dye vats?—We use a liquid colour, and we find no solid in the vessel at all; for instance, some of the aniline dyes are used in a liquid state.

10,721. They are quite an exception to other dyes?—Yes; we have no other colours which are liquid.

10,722. Take logwood and chromate of potash, and so on; when they are mixed do they not leave an insoluble material which is fixed in the cloth?—The colour which is in the wood we get into the liquor; the cloth is in a state to absorb that colour, and as soon as the cloth is properly dyed the result is insoluble.

10,723. Taking the material which is used, do you fancy that the whole of the dye is fixed in the cloth, or that a good deal of it remains behind in the dye liquid?—It greatly depends upon circumstances. I have seen the liquor as nearly clear as possible after dyeing. In the case of some colours nearly the whole of the colouring matter is absorbed into the cloth.

10,724. In the case of aniline dyes you suppose that the whole is absorbed?—Yes.

10,725. In fact, you can make the liquid nearly colourless in the aniline dyeing?—Yes.

10,726. Is the material in the dye refuse water in solution, or in suspension, or both?—It is both.

10,727. Have you ever seen any quantity of it allowed to stand, black dye refuse for instance?—No. I do not know that I ever noticed anything of that kind.

10,728. Do you think that it would become clear if it stood?—Generally our vessels are let out at night, but there are cases where they stand, and the liquor is as clear as possible the next morning.

10,729. Do you think that it is absolutely impossible to deal with that water in such a way as to stop the black solid material and to let the clear liquid pass away?—All that is wanted is sufficient room to allow the solid matter to deposit.

10,730. That is the great trouble, is it not?—Yes.

10,731. Supposing that space was no object, you say that this water could be left to settle, and that the greater part of the solid stuff could be separated by subsidence?—The whole of the solid matter going from our dye vessels would naturally and rapidly subside if we had space.

10,732. Supposing that any scheme of filtration was suggested by which the filtering surface could be obtained in a small space, and therefore the objection to large filter beds done away with, do you think that it would be absolutely impracticable to deal with the 50,000 or 60,000 gallons of water which you use?—There would be no difficulty in dealing with the water at all, but the difficulty would be in dealing with the solid matter deposited, because, in process of time, however large the storing bed might be, it would get filled with the subsiding materials which would have to be dealt with in some way.

10,733. Supposing a mechanical filter, and that the material separated got as solid as a book, and was in a cake, like oilcake, would not the difficulty be very much diminished?—The question still remains, what is to be done with it?

10,734. Is it vegetable or mineral?—Vegetable.

10,735. Would it burn?—I daresay that it would, it might perhaps burn in a furnace.

10,736. Supposing these hard solid cakes to be manageable, and to contain say 30 or 40 or 50 per cent. of water capable of being produced, but still to be almost dry to appearance, would they not burn if they were piled up?—I fancy that they would burn.

10,737. Would they not be like peat, or something of that sort, which would be combustible?—They are nearly entirely destitute of oil, and they would not burn very readily I think.

10,738. There would still be organic matter of some kind?—The whole of that which would subside out of dye materials like ours would burn; but I do not know whether there would be any profit in it.

10,739. I am not speaking of profit. Mr. Ripley said that they had found latterly that they could burn the rasped wood after it was taken out?—We use a great deal of rasped wood, from which we extract liquor, and that wood never goes into the drain at all.

10,740. If you can burn the rasped wood, which is vegetable, and if you say that the refuse from the dye vats is also vegetable, I suppose you could also burn it if you could get it into any manageable shape?—I should say so.

10,741. Then you would not say that the matter was out of reach of a practical result if you were required to stop this material from going away with the water?—I am sure that we cannot do it at this moment because we have not space for it.

10,742. You are dealing with the question of depositing tanks?—Yes; depositing tanks must be the first step in any amelioration of this kind. The next question is how to dispose of the solid matter which you propose to be in cakes; but there would be labour in doing it, it must pass through a press of some kind.

10,743. Do you happen to have heard of Needham's press?—No, I never heard of it.

10,744. It is a press which is used very largely at this moment by the potters for separating clay from water, and through one of these machines many thousand gallons are pumped off per day, the water going off clear, and the clay being stopped. A machine to separate one ton of clay will be about 10 feet long, seven feet broad, and four feet high; that is to say three or four of these machines might be worked in this room. The clay is separated from the water, and the clay is taken out in solid cakes, at a cost of 2*s.* 6*d.* per ton of clay so separated. The potters have now ceased in a great measure to dry their clay; they wash the clay and let the sediment subside; they run off the finer part of the clay and let it subside. Formerly the slush falling to the bottom was dried in kilns, but it is now pumped into these machines. If it could be shown that the water of your dye vats could be pumped (whether with or without chemical treatment) through a press of that kind, which would let the water go clear and let the solid matter remain in cakes, would there be any prospect of that being done?—I do not attempt to give an opinion upon that point, because clay mixed with water is a very different thing from our refuse.

10,745. Your difficulty is the inconvenience of these depositing tanks?—Yes.

10,746. Would the matter have a different aspect if a press of moderate dimensions were shown to you to be capable of doing the work?—If any process at all could be shown to be practicable for relieving parties below us of any nuisance or inconvenience attached to the necessary evil of a dyehouse I should be delighted to adopt it.

10,747. I suppose that if we asked for a press to be sent down you would not hesitate to adopt it?—No; but dyeing is an evident necessity in this country, and we cannot do it without using water.

10,748. (*Chairman.*) Nor without fouling water?—

Just so; and much more water is now used than was used formerly.

10,749. Is there anything further which you wish to add?—No. I believe that I have answered all the questions which were left undecided when I was previously before you.

The witness withdrew.

Mr. David Salmond (Bradford) examined.

10,750. (*Chairman.*) In what business are you?—I am a soap manufacturer.

10,751. In what part of Bradford are your works situated?—They are situated upon the canal bank, about 400 or 500 yards from the head of the canal.

10,752. Do you use the water of the canal for any purpose?—Not at all.

10,753. Do you use water in your manufacture?—Yes.

10,754. Where do you obtain it?—It is principally town's water, and what I collect from the roofs of the buildings.

10,755. What number of men do you employ?—15.

10,756. What volume of water do you use per day?—I use about 200,000 gallons a year from the corporation.

10,757. What do you pay them per 1,000 gallons?—1*s.* per 1,000 gallons.

10,758. What weight of soap do you manufacture?—I make 30 tons per week, or about 1,500 tons a year.

10,759. What name do you give to the soap?—Soft soap.

10,760. Is it all used in this district?—Yes. I produce samples of the highest and the lowest qualities.

10,761. What portion of oil do you use in it?—In the year I import about 800 to 1,000 tons of oil; for making the soap I use about 500 tons, and I sell the remainder.

10,762. Have you any refuse in the process of manufacture?—There is the refuse from the lime and potash pits. There is a difference of nearly 20*s.* per pack between the samples which I have produced. My soap is considered of very good quality, I get 8*s.* or 10*s.* a pack more than anybody else.

10,763. (*Professor Way.*) Is that mottling a mere question of fashion, or is it a necessity?—It is merely because persons like it, I think.

10,764. That, I suppose, is done by cooling the two ingredients separately?—Yes.

10,765. About what weight of potash do you use?—I import about 800 barrels a year, from 200 to 300 tons.

10,766. What weight of lime do you use?—About 100 to 150 tons of lime.

10,767. (*Chairman.*) Have you seen the Bradford canal on fire?—Yes, many times.

10,768. What sort of appearance did it assume when it was set on fire?—There was a blue flame mostly, and it would rise six feet. I have seen the flame rise over the gunwale of a boat.

10,769. Was it accidentally or purposely set on fire?—The boys do it on purpose; they reach over and stick a match in, and set the canal on fire.

10,770. Do you think that you could set it on fire to-day?—Not to-day; in consequence of the very heavy rainfalls which we have had there is very little scum.

10,771. (*Professor Way.*) Do they stir it up first?—No; I think that the combustible elements have chiefly arisen from the soapsuds which come down the canal, and which float.

10,772. These are not bubbles of gas which burst up and catch fire?—It is a gas, but I think that it is the fat swimming on the top, which catches fire as well.

10,773. The one begins it and the other carries it on?—Yes; I have seen the flame run along like gunpowder for 100 yards.

10,774. Like a will-o'-the-wisp?—Yes.

10,775. You say that this is a blue flame?—Yes; I have seen a boat completely made blue with the flame touching it, and running along the side of it; and I have seen the flame cover the whole of the drawbridge close to my works, and the white painted wood has been turned completely blue by the flame.

10,776. Does it give off opaque smoke?—There is very little smoke.

10,777. (*Chairman.*) Have you ever known any injury inflicted by the bursting out of this flame; has it injured the boats?—I remember at one time seeing a woman with some children on a boat; (the boat drivers generally have their families with them,) and I have seen a woman shrieking and making a noise, but I do not think that the flame would injure her, because it was only there for a moment. While the gas lasted the fire burnt.

10,778. But it frightened her?—Yes.

10,779. (*Professor Way.*) Is there any strength in the flame; is it capable of setting fire to wood?—I do not think that it is.

10,780. (*Chairman.*) Is the sluice from the beck into the canal near your works?—Yes, just opposite.

10,781. When they are drawing the beck water into the canal is there any additional nuisance?—The smell is frightful.

10,782. By the mixture and the evaporation of the gas?—Yes; and the sludge which goes down into the beck is very great.

10,783. When they are flushing the canal?—Yes.

10,784. Will they fill the canal up as far as your works; you have heard what they have said about it?—I have heard what they have said about it.

10,785. Shall you be pleased or sorry?—I shall be sorry in one respect, because I expect that I shall have to pay a larger rent for my property, but I shall be glad to have the canal shut up on account of the smell. It has injured my own health very considerably. A few years ago I was obliged to go away every year.

10,786. How has it affected the health of your workmen; have you heard them complain?—Yes, they complain occasionally. I have two men away now on the sick list, but I think that that is more from old age.

10,787. (*Professor Way.*) I suppose that they may suffer from this smell without being actually incapacitated or killed by it?—Yes; it produces a nausea in the stomach, and you cannot take your food. I do not know that it has materially injured my health, but I have known many times that having gone early in the morning I have had a nausea in my stomach, and could not take my breakfast when I came back again. I now take something before I go out.

10,788. The whole of the water which is used in the manufacture of this soap goes into the soap, does it not?—Yes; we have no refuse water; we do not make any hard soap. What refuse we have goes into the lime pits, and the farmers are glad to get it for manure.

10,789. If you used hard water for making soap would it make a material difference to you?—I think so.

10,790. You do not use a large quantity?—No.

10,791. But still soft water is better?—Yes, the amalgamation is more complete.

10,792. Have you any difficulty in getting rid of your refuse lime?—We have a difficulty sometimes in getting rid of it, but when a farmer once knows the value of it he comes again.

10,793. You do not throw it into the canal?—No, we throw nothing into the canal.

10,794. If it were thrown into the canal would it tend to purify the canal if properly adjusted and managed?—Yes; a large quantity of sulphate of potash is in the lime, which would tend to purify the canal considerably.

The witness withdrew.

BRADFORD.

Mr. J. M. France.

15 Nov. 1866.

Mr. JOHN M. FRANCE (Bradford) examined.

10,795. (*Chairman.*) What point do you wish to speak to?—I will put before the Commissioners a note from Lord Robert Montagu, dated in 1864. I collected some evidence with respect to the state of the river Aire about Leeds and the sewage from that town. I also prepared information to lay before a Committee of the House of Commons respecting the amount of artificial tillage required by the farmers in the circuit of Leeds, including Bradford. I will put in those minutes before the Commissioners.

10,796. Are you in any business?—I am not in any business at present except as a public accountant.

10,797. You have taken up the question of sewage application or utilization as an amateur?—Exactly.

10,798. And you have studied the question?—Yes; and I have obtained all the information which I could from other sources, and I have studied and seen how far sewage can be applied to the neighbourhood of Leeds where I live. Some years ago I was a manufacturer of artificial manure and a considerable dealer in it. That brought me into contact with the subject, and it enabled me to see how far the sewage of towns could be generally applied to a beneficial purpose amongst the farmers, and also to see how far they would be disposed to use it if it was furnished to them. What I want more immediately to draw the attention of the Commissioners to is this, that the agriculturists of the kingdom generally have become very much addicted to the use of Peruvian guano for the growth of their crops. The parliamentary returns of late years, however, show that there has been a great reduction in the amount of guano imported, and there is a considerable probability that in a few years, perhaps in 10 or it may be 12 years, the importations into this country may almost cease. It then becomes an important question what is to be substituted for this guano. The next point to which I wish to draw the attention of the Commissioners is, that in the year 1860 I took an estimate of the quantity of artificial manure used in the district within 15 miles of Leeds, independently of fold yard manure. I have the names of the principal dealers, and the amount which they are reported to have purchased during that year, of guano and of other things, such as bones, rape dust, and artificial manures. I have the quantity and the value. In 1860, in a circuit round Leeds, the total value of guano and other tillages amounted in round figures to 143,500*l.*, and of that sum about 100,000*l.* would be actually paid by the farmers for guano. It struck me that that question would probably open a market for the sewage of such towns as Leeds.

10,799. Then would you contemplate solidifying the sewage?—The question of solidifying is a very difficult one, and I think that it is scarcely practicable from the experiments which have been carried out. The only available plan, as it seems to me, is to raise the sewage bodily to such an elevation that it would flow by its own gravity over the lands requiring it for cultivation. There seems to be no difficulty about it. I have prepared a plan at Leeds, and a similar diagram was laid before you by Mr. Filliter, of Leeds, of the quantity of land which would be available if the sewage was raised 25 feet in the immediate neighbourhood of the outfall of the Leeds sewage. That plan was coloured to show the contour lines. The raising of the sewage 25 feet from the outlet of it would enable it to cover about 5,000 acres.

10,800. (*Professor Way.*) Did not Mr. Filliter say that he could get another 5,000 acres?—Yes, by another elevation. That is the district over which the consumption of guano here prevails. There is another question which is involved in the application of sewage, namely, the expense of raising the immense quantity of water mixed with it, to the amount of 4,000,000 gallons, which the Leeds people are throwing into the sewers; there is a difficulty too in dealing with the question of storm water.

10,801. (*Chairman.*) The Leeds sewage is now 8,000,000 gallons?—Yes; but in 1860, the time which I am speaking of, it was about 4,000,000 gallons, and of course it would constantly increase. I have tried some experiments which I exhibited before the Committee at Leeds under the Diseases Prevention Act, and which were laid before the board of guardians. The town council threw cold water upon it, but the board of guardians requested me to attend before them, which I did, and I showed at how very little expense the sewage could be deodorized so as to render it nof offensive to the neighbourhood. I also showed that the sedimentary matter, instead of being deposited, could be raised. In the case of a still sewage like that at Leeds, where the sewage goes at a very slow pace, the mixture of a liquor which I prepared, and which consisted of a strong solution of salts, at boiling heat, would throw the whole of the sedimentary matter of the sewage to the surface; the whole of the mechanically suspended matter was immediately thrown to the surface.

10,802. (*Professor Way.*) Those are salts which are first boiled?—Yes, and then they are put to the 8,000,000 gallons of water. The quantity of salts required is very minute compared with the quantity of water; about one gallon of a strong solution of salts (I use a triple salt) would convert at least 10,000 gallons of the sewage and make it comparatively clear, it converts the floating matter into a kind of flock; there appears to be an evolution of gas which carries the flock to the surface. I would then raise the surface water by means of a float wheel and would take the body of the sewage along with the liquor to a higher elevation, and so dispose of it, and let the clear water run into the river. It appeared to me that the salts which I used had the chemical effect of fixing the phosphoric acid and the ammonia and the other acids in solution, that they were fixed and mixed up with this floculent matter, and the whole would be available for the cultivation of crops whilst the substratum of water would flow comparatively free from acid or any poisonous matter. It appeared to me that an experiment of that sort was required to prevent having to deal with the increased body of water which is constantly flowing from large towns.

10,803. (*Chairman.*) Have you analyzed the effluent water of the sewage after it has been treated by the salts which you speak of?—No, I merely judged by the taste and the appearance of it.

10,804. Do you know that, so far as chemists have yet gone, any mode of treating sewage which separates the solids but very slightly affects the salts in solution?—That is as I understand it. The valuable part of the sewage is in solution.

10,805. And under any treatment which has yet been proposed it remains in solution?—There would be a small waste, but it appeared to me from the taste and the appearance of the water that the acids were completely neutralized. Whether the phosphates were re-dissolved I do not know, but I think that they were converted into an insoluble salt. I used salt of magnesia.

10,806. (*Professor Way.*) You know that phosphate of magnesia is to a certain extent soluble in water?—I used magnesia, but it appeared to me to convert the phosphate of magnesia into an insoluble salt which rose to the surface buoyed up by the gases which were liberated. The inference which I drew from the action of the salts was that the rapid action and the evolution of gas at the same time from the soda contained in the water buoyed up the fatty matter, and that the phosphate of magnesia and all rose to the surface. Apart from the question of deodorization it struck me that we could thus get the floculent matter contained in sewage more rapidly than by letting it deposit.

10,807. (*Chairman.*) Have you read the Reports of the Royal Commission appointed to inquire into the utilization of sewage?—I did so in 1862, I think.

10,808. There are three Reports by a Special Commission. Professor Way was a member of that Com-

mission. Mr. Lawes, the great agriculturist, was another member of it. Lord Essex represented the House of Lords, the late Mr. Ker Seymer represented the House of Commons; Dr. Simon, the late Dr. Southwood Smith, the late Mr. Austin, and myself were also members of the Commission?—I remember those names very well. I have not seen the reports of that Commission subsequent to 1862. I would merely wish to say to the Commissioners that, whatever method is discovered for dealing with the sewage, it is very requisite for the country that it should be applied as soon as possible.

The witness withdrew.

Adjourned to to-morrow at 11 o'clock, at Halifax.

Subsequently to the inquiry at Bradford the Commissioners received the following letter:

Gentlemen, Bradford, 17th Nov., 1866.

Having been from home I was sorry to find that the inquiry of the Commission on the Pollution of Rivers here had closed without my having had the opportunity of offering my opinion on one or two points which I have not seen in the evidence given in Bradford and other places.

I have been an employer of thousands for the last 40 years, during which period no nuisance has been created in connexion with the works of my firm (Walkers & Co.) by either the gasworks, wash-houses, or privies. The tar and gas water are sold at a good price and regularly carted away in close barrels. The soapsuds are subjected to an operation which extracts the grease and animal matter, for which a considerable sum is obtained. As regards the privies they are so constructed as to receive all refuse into closed carts, which, when full, are drawn out in the night and carted away by farmers into the country, who also pay a certain price for the same.

On these grounds, and because of the practicability of avoiding nuisance if proper legislation were entered upon I consider that all the refuse of houses could be collected and utilized I think that each householder should be required to arrange for the removal of these things daily or weekly, or as the case may require. I need not advert to the imperative necessity of saving all these things for manure, as we have the highest testimony that if we continue to waste them the produce of the soil of this country must necessarily fall off seriously. The mode I would pursue is in all new buildings to have a large pipe into which smaller pipes might convey all the contents of waterclosets, &c., and this large pipe should fall into a close box or cart sufficiently large to contain a ton or tons of refuse. That this cart should be placed in an arched receptacle on the ground floor, level with the street. That neat cast iron doors should be placed at the entrance, which could be opened for the purpose of drawing out the full cart and placing therein an empty one. And as regards houses that have been built sometime all persons should be required to make similar provision within a certain time. These carts should be conveyed to the nearest railway station in the night to the destination, which might easily be arranged by contract with farmers who now pay immense sums for guano and other expensive manures, not much more valuable than the refuse I am alluding to. No doubt the undertaking would be a great one and expensive, but yet it is quite practicable and would be remunerative and profitable. Manure stations would be provided by the railway companies as they would find it a source of large revenue. I ought to have said also that the builders of houses in blocks or streets might so place the main pipes as to have them to serve for more houses than one. This is pretty much what I wished to state to the Commissioners on this subject.

I also wished to allude to the making of reservoirs, which in my opinion are constructed on so large a scale as to be dangerous in many instances, and by experience they have proved so to the great destruction of life and property.

I think that no single reservoir should be made beyond a certain safe size. Why not, when a large supply of water is wanted, construct two, three, or four instead of one along side each other, and let a pipe from each unite at a little distance in a larger one? Thus the limited size would prevent any dangerous pressure during high winds or floods, which is the great point to be obtained for the public safety. I will add no more except to confirm the opinion generally offered, that no good will be done except by imperial legislation, and for this the country is fully prepared.

I am, Gentlemen, your obedt. servant,

To the (Signed) W. WALKER.

Commissioners on the Pollution of Rivers,

&c. &c. &c.

The following Statistical Tables relative to the woollen and worsted trades were furnished to the Commission by Mr. Jacob Behrens, vice-president of the Chamber of Commerce of Bradford.

A.

ESTIMATE of the PRODUCE of WOOL in the UNITED KINGDOM, from 25,795,708 Sheep based upon a RETURN made for GREAT BRITAIN on the 5th March 1866 and for IRELAND in 1865.

MEM.—The number of sheep in Ireland under one year old is supposed to bear the same proportion to the whole number as that given in the Return for Great Britain.

	Number of Sheep.		Weight per Fleece.	Wool produced.
	Under one year old.	One year old and above.		lbs.
In England - -	4,505,345	10,620,196	6½ lb.	69,031,274
„ Wales - -	380,354	1,287,809	5½ „	7,082,950
„ Scotland - -	1,624,638	3,630,439	6½ „	23,597,853
„ Ireland - -	1,043,491	2,640,251	6 „	15,841,506
„ Isle of Man & Channel Islands.	24,489	33,196	6½ „	215,774
	7,583,817	18,211,891		
Under one year old Hoggets.	5,583,817	- -	6 „	33,503,293
Lambs killed and clipped	1,000,000	- -	3 „	3,000,000

Bradford,—12th December 1866. (Signed) JACOB BEHRENS.

Halifax, Friday, 16th November 1866.

PRESENT:

ROBERT RAWLINSON, ESQ., C.B., IN THE CHAIR.

JOHN THORNHILL HARRISON, Esq. | Professor THOMAS WAY.

WILLIAM WIGHTMAN, Esq., M.D. (Halifax), examined.

W. Wightman, Esq., M.D.

10,809. (*Chairman.*) You are resident in the borough of Halifax?—I am.

10,810. How long have you resided in Halifax?—Rather more than 10 years.

10,811. I believe you were mayor of the borough last year?—Yes.

10,812. You are now an alderman of the borough?—Yes.

10,813. Are you chairman of the Sanitary Committee?—Yes.

10,814. Can you give the Commission any opinion as to the sanitary condition of the borough; is it at all affected by the foul condition of the streams?—The borough is at present in a very much better sanitary condition than it has ever been, for many years ago it was in a very bad state from want of drainage, and ill-ventilated houses, and people being crowded together, and cellar dwellings, and many other causes, but latterly the sanitary committee and the corporation generally have done so much towards improving the condition of things that the health of the town is very much better than it has ever been. I believe it ranks now with any town in the kingdom of the same size and condition, as far as the rate of mortality goes.

10,815. As a corporation, I believe, you have carried out waterworks?—Yes, to a considerable extent.

10,816. Is the water of a very pure character?—Very pure indeed; it is superior to what is generally met with elsewhere.

10,817. You have carried out, I suppose, a system of sewerage?—Yes, we have, an extensive one. The sanitary committee have paid considerable attention to that; they are ventilating the sewers at the present time. We wished to know what was the best system of carrying that out, and we have been waiting for information.

10,818. What is the present rate of mortality as compared with the past?—Our borough has been very much increased in area this last year, and therefore we are not able to say comparatively what the rate of mortality is; but it is something like 24 per 1,000 this year, but that includes the deaths in the union of many individuals who come from out districts, and who die there very shortly, and these deaths ought not to be put down to the borough.

10,819. Do you know anything of the streams beyond the borough?—Not much.

10,820. Are there any manufacturers above upon the streams out of the borough?—Yes, there are some.

10,821. Supposing the people of Halifax did all they could do to sweeten and purify their own district, do you think that would be setting so good an example that all parties outside the borough would necessarily follow it, and purify their districts?—I think purification ought to commence at the head of the stream; the water ought to be pure before it comes here.

10,822. Some jurisdiction is necessary beyond your own borough?—Yes.

10,823. If any interference takes place with the streams, I suppose you would say that it should be general and not special; not that one borough, or one set of manufacturers should be interfered with, but the whole?—Yes.

10,824. (*Mr. Harrison.*) From your own knowledge,

HALIFAX.

W. Wightman, Esq., M.D.

16 Nov. 1866.

as a medical man, practising in Halifax, can you testify to an improvement in the health of the population?—Yes, I can. Halifax is very advantageously placed as to rainfall; we have it here very heavy, which is very important, because it washes out our drains and sewers, and that has been one means of reducing the unhealthiness of the neighbourhood and making the town better. Four or five years ago the death rate was 34 per 1,000, now it is something like 24; I am speaking of the borough of Halifax; but one reason why the rate is so much reduced may be owing to the increased area of the borough; it was 1,000, now it is 3,000 acres.

10,825. You now take in a large agricultural population?—Yes.

10,826. (*Chairman.*) The death rate has been so reduced?—Yes; at the same time I do not know that comparing Halifax with towns of a similar area, Blackburn and other places, our death rate is favourable, it is much lower at the present time than theirs.

10,827. (*Mr. Harrison.*) In your own experience and practice you have found that the health of the town has improved?—Yes.

10,828. Have the sewers been constructed since you were in practice?—Yes, it was about the time when I came here, 10 years ago.

10,829. How was the sewage taken away before you came here?—It has always gone into the Beck ever since I came, the works were even then so far advanced as that.

10,830. Are there any cesspools now existing?—Very few, if any; I do not know of any.

10,831. Apart from the death rate, do you see an improvement in the health of the people?—Their diseases are not of so virulent a character generally as they were; it is many years since we had a very malignant attack of any of the more severe epidemics; we have had no cholera.

10,832. Have you observed any ill effects from want of ventilation in the sewers?—I have always thought of that.

10,833. Has anything come under your notice?—I have attributed the ill health of the inhabitants to bad air and want of ventilation.

10,834. Has that been in the upper parts of the town or the lower?—As much in the upper parts of the town as in the lower. The gases rise up and get into the houses. One means of ventilating the sewers has been by pipes, the water conductors have acted as ventilators, and this renders the effluvia liable, under certain circumstances, to get into houses.

10,835. Are the upper parts of the town inhabited by the wealthier classes?—By the better classes of the workpeople and the wealthier classes too.

10,836. The effect of an ill-ventilated system of sewerage is to remove the sources of disease from the lower parts of the town to the upper parts of the town?—Yes.

10,837. Is there anything further that you wish to add?—I do not know that I can say anything more. We have about 960 waterclosets, and about 11,500 houses inhabited, and the sewerage generally is, I think, in as perfect a condition as can be expected.

The witness withdrew.

J. E. Norris, Esq.

James Edward Norris, Esq. (Halifax), examined.

10,838. (*Chairman.*) You are town clerk of the borough of Halifax?—I am, and a native of Halifax.

10,839. You have known it from your boyhood?—Yes.

10,840. What length of time have you occupied the position of town clerk?—About $2\frac{3}{4}$ years.

10,841. What is the area of the borough of Halifax?—The area of the present borough is 3,768 acres. I have got an ordnance sheet here, which it might be useful to the Commissioners to refer to (*handing in the same*).

10,842. Has the area of the borough been recently extended?—Yes.

10,843. Since the charter of incorporation as a municipal borough?—Yes; I will briefly state to the Commissioners what our local government is. The town of Halifax is situated on the Hebble and Ovenden brooks, which are tributaries of the Calder. The borough is under the government of a council as a municipal corporation, and as a local board of health. The Public Health Act was applied to the borough in March, 1849, and confirmed by a supplemental Act in 1851. In 1848 a charter of incorporation was granted, and the powers of the local Commissioners, who acted under the Improvement Act, called the Halifax Improvement Act of 1823, were transferred to the corporation by a provisional order, on the application of the Public Health Act. I have here a copy of Mr. Ranger's report, which was made upon a preliminary inquiry previously to the issuing of the provisional order. I will also put in the provisional order itself, and the schedule to it, confirming it: portions of the Act of 1823 were repealed, and portions were made applicable to the extended area of the borough, the Act of 1823 only applying to the township of Halifax. When the Public Health Act was applied to the borough the drainage of the town was in a very imperfect state; in fact there was no system whatever of drainage. The town falling rapidly towards the Hebble, everything drained into the Hebble, and all the sewers that then existed emptied themselves into the Hebble; but a plan was obtained from Mr. Ranger for draining the town, which is shown by the red lines on this plan (*pointing to the same*). The main intercepting drain, which runs parallel with the Hebble, collected all the sewage of the area of the borough, and discharged it into the Hebble at a place near the "Atlas" Works at the southern boundary of the borough in 1853. The reason why the outfall was made at that point was because under the then existing Acts of Parliament Public Health Boards could not drain beyond the limits of their own district, but subsequent legislation has given them power to extend the area so that they may, if they choose, carry the sewage into other districts and utilize it, under the Act of 1865, for irrigation purposes. At the present time the outfall is at that point (*pointing to the plan*). In 1865 we obtained an Extension Act, by which the boundaries of the borough were extended, as you will see by this pink line. The old area of the borough was 1,220 acres; it is now 3,768. We have already commenced partially to drain the suburban districts, which have been recently taken in, and we have entered into one contract, which is to cost us, I believe, a sum of 3,000*l.* We have already commenced to prepare main arterial drains to include the more populous parts of the suburban districts, and we shall extend that system as the population increases. The original cost of the main drainage of Halifax was about 65,000*l.*; we had expended something like 66,000*l.*, a portion of that money was recovered from private individuals in the shape of payment for private improvements. We have expended now about 65,000*l.* for drainage purposes.

10,844. Is the present area of the municipal borough and the parliamentary borough coincident?—No; the parliamentary borough is coextensive with the old borough. If you recollect, under the Municipal Act there was power for the Queen to grant a charter of incorporation to the boroughs mentioned in the Reform Act, and that Act defined the boundaries. Of course you could afterwards, by subsequent application, apply to the Privy Council for an extension of the boundary by petition, but we preferred doing it by Act of Parliament; we wished to extend the operation of our local legislation to the whole area, a charter from the Queen would not have done that, it required Parliamentary enactment.

10,845. Then the Parliamentary borough is less than the municipal borough now?—Yes; the part coloured blue shows the old boundary.

10,846. Which is very unusual?—Yes, but we are a little in advance of the time.

10,847. (*Mr. Harrison.*) What does that circle

HALIFAX.

J. E. Norris, Esq.

16 Nov. 1866.

(*pointing to the plan*) represent?—The area of our water supply.

10,848. (*Chairman.*) Upon the area of 3,768 acres what is the population at present?—56,000 is our estimated population.

10,849. What was it at the last census?—The old borough, at the last census, contained about 37,000.

10,850. What was the population of the new borough in 1861?—I should think about 45,000; we now call it 56,000.

10,851. What is your rateable value?—165,000*l.* upon the extended boundary. I can give you a few figures to shew the rapid increase which has taken place in Halifax. In 1849, the annual rateable value in the borough, taking, say, the present Parliamentary limit, was 63,117*l.* 15*s.* 10*d.* In 1854, the rateable value was 77,414*l.* 3*s.* 4*d.*. In 1860. it was 108,177*l.* 4*s.* 0*d.* In 1864, 120,139*l.* 17*s.* 0*d.* In 1865 we went to Parliament for an extension of area, and the rateable value of the extended area was 158,208*l.* 6*s.* 8*d.* This year, at the present time, it has increased to 165,007*l.* 19*s.* 3*d.*

10,852. Is the borough still increasing in value rapidly?—Yes. I think we have had something like 300 plans sent in for houses, mills, and warehouses this year, but it has been a bad year for building, for everything has been dear; and last year I suppose we passed more than that probably.

10,853. You have now acquired the power of supplying the borough with water?—Yes. In 1853 we obtained an Act for the construction of waterworks.

10,854. Had none existed previously?—To a very limited extent. The town before 1853 was supplied from two springs, one called Birks Hall, and the other called Well Head.

10,855. Had any person a vested right in them?—No, they belonged to the commissioners of the town; they were transferred to the council when the powers of the previous commissioners were transferred to the council, but that was so insufficient a supply that the corporation went to Parliament in 1853 and obtained an Act to supply the town with water. This plan shows what that system is; the brown portion shows the township of Ovenden, and that portion (*pointing to the same*) is the valley of the Lud, the scheme embraced two sources. The Ogden scheme for the construction of a large reservoir with a capacity of 220,000,000 gallons, called the Mixenden Reservoir, and the Luddenden Valley scheme for the construction of a large compensation reservoir of 90 acres, and other service reservoirs. Thus there were two systems, which met at Ramsden Wood, and from Ramsden Wood the water is conducted first to the service reservoirs in the town, the Albert Reservoir and the Victoria Reservoir, and two other reservoirs called Hanson-lane, into which the water from Birks Hall was conveyed.

10,856. What is the surface area, the height of the embankment, and the capacities of each reservoir?—The drainage area of the Ogden district, which is now appropriated, is 1,220 acres.

10,857. Will you state the rainfall?—The Ogden Reservoir is capable of holding 220,000,000 gallons of water, and the deepest part is 66 feet.

10,858. What is the average rainfall?—36 inches would be the minimum, and 42 the maximum of that district.

10,859. (*Professor Way*). What is that blue line; is there a right to take water from the district or deliver it?—The area of supply is shown by that blue circle, and that blue circle is a distance of two miles from the extreme boundaries of the borough.

10,860. (*Chairman.*) Have you scheduled all those townships?—Yes, they are defined by our Act.

10,861. (*Professor Way.*) Has that any relation to the drainage area of the district?—No, not of the Hebble alone.

10,862. Have you a right to supply any part of the Huddersfield district?—No, we do not go there. The hills divide Halifax and the Calder from Huddersfield, but we can supply anywhere within that circle or within the townships which form an outer boundary beyond the circle.

10,863. (*Mr. Harrison.*) What is the radius of that circle?—I think it is six miles nearly.

10,864. (*Professor Way.*) If you deliver to all parts within that radius, will you be taking water from one valley into another?—I do not think it is physically possible to deliver water to all parts of the circle as some of the places are above the level of our supply reservoirs, but Parliament requires that Water Bills should state the area of supply. Within that area of supply there are no fewer than 12 local boards. We are at present supplying Sowerby Bridge; we are under a contract to supply the Elland district on the 1st of January, which is a place lower down on the opposite side of the Calder and has a local board. The Brighouse people are negociating terms with us to supply them with water and they have a local board. The Greetland people are also asking us for water, and in laying our pipes from Halifax to supply Brighouse we shall supply a large and populous district between Brighouse and the borough.

10,865. (*Mr. Harrison.*) Is the Ogden reservoir in the valley of the beck leading down to Halifax?—Yes, it is at the head of the Hebble valley.

10,866. Where are your reservoirs?—The existing works which we have now supplying the town are all in the Hebble district. We are now constructing new works in Luddenden valley; the Lud is also a tributary of the Calder. The cost of the productive works, including distribution, is 160,980*l.*, and we have already expended 64,357*l.* upon new works, making a total of 225,338*l.* in waterworks.

10,867. What do you contemplate expending before your works will be complete?—The entire scheme will cost us 300,000*l.*

10,868. What is your present income from the waterworks?—Our present income is 11,040*l.*; it was that last year; out of this we had to pay the cost of maintenance and interest of debt. For of course upon what we have expended in works yet incomplete and therefore unproductive, there is a present loss.

10,869. Do you levy a rate in aid?—No, we have other property the surplus profits of which go into the borough fund and we can pay the interest out of the borough fund without levying any rate in aid.

10,870. What volume of water do you supply annually from your works at present?—From our productive works in the Ogden and the Hebble districts about 1,250,000 gallons per day.

10,871. How much of that do you sell for trade purposes?—On the average 292,500 gallons a day.

10,872. At what price?—It varies according to the scale. I have a table which will show you the progressive state of our waterworks and income. The first column gives you the amount of expenditure on productive works, the second on unproductive works, the total income, the total amount of charge on productive works, exclusive of millowners' compensation, the amount paid to millowners for compensation, the interest on the net outlay for nonproductive works, the surplus on productive works, not including millowners' compensation, and so on, the net surplus, the net deficiency, the average quantity of water daily supplied, the quantities supplied for trade purposes and the quota supplied for domestic purposes. We have analyzed our trade sales in this way. Dyers and scourers, woolwashers, and supply for steam boilers, Local Boards in the district, and sundries, such as water supplied for small machines for moving-printing presses.

10,873. Is your water used for power in small establishments to any extent?—Yes; 34 per cent. of the water that is sold for trade purposes is used to generate steam.

10,874. Or for water power?—No, not for water power.

10,875. (*Chairman.*) You have no dolphins or things of that kind?—No, nothing of the kind; the water goes through our meters.

10,876. (*Professor Way.*) Do you not supply for lathes?—I know of two small machines in town that are used for turning printing machines. The accountant says that there are about half a dozen small

water power engines that are worked by the pressure of water. As to the percentage, dyers and scourers take about 21 per cent. upon the whole of our consumption, woolwashers 12½ per cent., steam boilers 34 per cent., Sowerby Bridge Local Board 21½ per cent., and about 19½ per cent. is used for sundry purposes; that is the return for 1866. One thing is very striking in this table. If you refer to this table you will find that when we had plenty of spare water for sale the percentages of certain trades were considerably larger than now. In 1861 when our works were in full operation dyers and scourers were using 72 per cent. of all the water, woolwashers were using 10 per cent., and steam boilers only 14 per cent. Now gradually the small manufacturers who have steam-engines are taking the water through meters for steam condensing purposes and those who usually used water in great quantities in bulk cannot now have it; we have to restrict them until the new works come into operation, so that there is a gradual falling off in the using of large quantities of water in bulk and a gradual increase in the consumption by meter. I will hand this table in (*handing in the same.*)

10,877. (*Chairman.*) What will be your entire daily volume when the works are completed?—From the Ogden and Hebble districts and from the Luddenden district when they are completed, our daily quantity, after giving compensation to the millowners, will be 3,700,000 gallons a day.

10,878. Will that be the total volume you will have at command?—Yes.

10,879. Do you know what quantity of water you give for compensation?—Yes; we have to discharge down the valley of the Hebble under the provisions of the Halifax Improvement Act of 1853 3⅔ cubic feet of water per second during 12 hours of every working day, about 950,000 gallons, omitting Sundays. Then in the Luddenden Valley the quantity of water given for compensation, including some reservoirs on the Warley Moor will altogether be 5⅓ cubic feet.

10,880. In gallons per day how much will that make for compensation?—About 2,000,000.

10,881. You use 3,700,000 gallons and you pay 2,000,000 in compensation?—That will be the state of things when the system is completed.

10,882. Having paid that compensation have you such uncontrolled command of the area that you could add to your reservoir room at any period?—Not without special parliamentary powers.

10,883. You do not obtain the entire use of the district upon paying that stipulated compensation?—No, we were limited specially to the area shown on the plans, and we could not take our catchwater drain any further than a given point.

10,884. What was the name of the reservoir that I visited?—That was the Ogden reservoir.

10,885. Supposing that you wanted to raise that reservoir five or six feet so as to obtain 50,000,000 of gallons more water, you could not do it without special arrangement?—Yes, we could raise the embankment, no doubt but we should not have sufficient catchment area. I am now speaking from the evidence we have received from Mr. Bateman.

10,886. Have you such control over your area that if nature will allow you to extend your reservoirs you can do it without increasing your compensation?—You cannot raise your levels above a given height according to the standing orders.

10,887. Could you not make a second reservoir at the foot of it?—Not unless we acquired the land.

10,888. If you acquired the land could you then make a second reservoir?—I think we could but we should have to pay compensation to the millowners.

10,889. You have not sought for nor obtained an uncontrolled right by paying a fixed sum?—No, we were anxious to get it in 1865, but we were opposed by the millowners.

10,890. If you increase the volume for use in Halifax you must treat with the millowners?—Yes, undoubtedly, the more gathering ground we appropriate the more compensation they require in return. In 1864 and 1865 we were obliged to limit the trade and curtail the domestic supply.

10,891 (*Professor Way.*) Did you raise the price of the water?—Yes, last year on our trade sales, but not for domestic consumption.

10,892. (*Mr. Harrison.*) What is the population within the circle you supply?—We estimate it at present at 92,000.

10,893. Independently of the borough?—Including the borough, that is the population that we estimate we could supply from our system of waterworks; of course it is increasing rapidly.

10,894. (*Chairman.*) If the population which you had power to supply amounted to 100,000 and you supplied them with 20 gallons per head, that would consume 2,000,000 of gallons of your water, and you would have left for trade purposes 1,700,000 gallons when the arrangements are completed?—Yes, which is certainly too small. We have the uncontrolled use of the area within which water is now collected, but I do not think we could appropriate any other portion without further parliamentary powers, and we therefore must go to Parliament for an extension of our water supply.

10,895. Both in Liverpool and in Manchester they have been driven to the expedient of buying off in money the compensation in water which they were bound to give by Parliament?—We wished to have a similar clause put into our bill in 1865 but we were strongly opposed by the millowners, we only asked for permissive power to treat with the millowners.

10,896. Your Act of Parliament defines the conditions you are placed under with regard to any better supply in dry seasons?—Yes. If we do not send down the stipulated quantity we are bound to pay a penalty of 10*l.* a day to every occupier of the stream.

10,897. Has that penalty yet been inflicted upon you?—Yes, in 1862, which was the first year, we paid 902*l.* 17*s.* 3*d.*, in 1864 we paid 179*l.* 5*s.*, and in 1865 when we went to Parliament we paid 4,373*l.* 4*s.* 6*d.*

10,898. It is of the utmost importance that the authorities in the borough should be in a position to avoid these heavy fines?—Undoubtedly. I consider that the welfare of Halifax depends upon our having an unlimited supply of water.

10,899. (*Mr. Harrison.*) Have you had a valuation made of the mill-power to which you now give compensation?—Yes, I have a table here which I will hand in which probably may give you an approximate idea. The penalty is not solely for water-power mills, the words are "to all occupiers of mills and other works on the Hebble," so that every man who draws a few gallons of water for condensing or washing purposes; even a basket-maker, if he knows we are not sending down the full quantity, can claim 10*l.* a day just the same as the largest manufacturer. This is a Table showing the number of mills upon the Hebble and Ovenden brook from Salter Hebble upwards to the head of the valleys. There are altogether 40 mills on the Hebble and 10 on the Ovenden Brook, making a total of 50 mills. The total annual value of those within the borough is 32,324*l.*, and of those beyond about 6,000*l.* It gives the names of the occupiers, the trade or manufacture, and the stream from which they take their supply, it is more or less also a list of those mills which draw from the canal which is fed from the Hebble. There is also a column showing the average daily consumption of water taken from the corporation for trade purposes, and that which goes through a meter into their premises is discharged either into the river or into a sewer.

10,900. Are you under any obligation to supply the canal with water?—None. The canal proprietors have parliamentary power to take water from the Hebble. The total average daily consumption of water through meters at those mills on the stream is 91,830 gallons, but it is a very small figure. In 1862 I think it would have been something like 200,000 gallons a day.

HALIFAX.

J. E. Norris, Esq.

16 Nov. 1866.

10,901. (*Chairman.*) Under your present system of sewerage the sewers empty themselves as you have stated at the edge of the boundary of the old borough?—Yes.

10,902. Does the sewage cause any nuisance there?—Yes, undoubtedly; the most poisonous.

10,903. Has it been complained of by any residents near to it, or millowners below?—No, we have never had any formal complaints.

10,904. I suppose that this source of nuisance is mixed up with other nuisances?—Just so; the river is much polluted above that outlet from different causes.

10,905. If you extend the use of waterclosets beyond the borough and allow that existing outlet to continue the pollution will be largely added to?—Undoubtedly.

10,906. It might become so serious as to make you liable to an indictment?—Yes, no doubt of it.

10,907. Have you (since you have been Town Clerk) discussed the question as to the propriety of carrying away the sewage?—Yes; our engineer was instructed at the beginning of the year to report as to the mode of dealing with the outfall sewage of the town, and he no doubt by this time would have made his report upon it, but he found that you would be coming here and has, no doubt, delayed it until he should know what the result of this commission would be.

10,908. Does a great portion of the drains go into a beck called the Red beck?—Yes; a portion of the drainage area of the borough falls towards it.

10,909. Is there any pollution of any serious consequence there?—Nothing particular, but there is a circumstance connected with the proposed drainage of that district which is worth mentioning to you just to show what difficulties may arise when you wish to get rid of the sewage even for irrigation. We proposed to make a main drain to carry off the Charlestown drainage towards the beck, and we received notice from Mr. Lister, a large landowner and others, that if we attempted to drain into the Red beck they would apply to the Court of Chancery for an injunction. We then suggested that Mr. Lister being a large landowner should take this sewage and apply it for irrigating purposes on his land but he declined to listen to the proposal, saying that his land was park land and not meadow land. We are therefore now in this dilemma that we have no outfall on that side of the hill, and we do not know in what position we may be placed,—we may have actions and injunctions coming against us on all sides.

10,910. What is the state of the law with regard to these nuisances as to prosecutions and indictments?—It is in a most unsatisfactory state: in fact we are at the mercy of anybody who can complain of our acts as being nuisances and injurious to health, and we can compel nobody to refrain from throwing their refuse and drainage into the brooks. We are in that position that we may be indicted for a nuisance or have an injunction obtained against us.

10,911. As a municipal corporation you are entrusted with the good government of the borough?—Yes.

10,912. A part of that good government consists in improving the health of the borough?—Yes.

10,913. If making good sewers and drains would tend to that end you would I presume conceive it your duty to make them?—Yes, undoubtedly.

10,914. As the law has provided you with no efficient means of getting rid of the refuse it is passed into the nearest watercourse is it not?—Yes.

10,915. Then you are open to proceedings from the landowners on the river below you for fouling the river?—Yes.

10,916. Therefore as the law stands you are liable to be sued for having effected a purpose which you were appointed to carry out?—Yes, that is the state of the law now.

10,917. I suppose you would wish, if it were practicable, that parliament should examine into this question either through the present commission or in any other way and, if possible, provide you with some more efficient means of dealing with nuisances which result from improving the health of your district?—We cannot carry out a proper sanitary system unless we have some parliamentary protection and means shown to us by which we can get rid of this outfall.

10,918. How many houses are there in the borough? About 11,000.

10,919. How many waterclosets are there?—960.

10,920. What number of ashpits and middens are there?—I do not know. The inspector of nuisances will tell you. I have a Table here which shows what we have expended in cleaning out ashpits and the charge upon the rates in each year from 1854 down to 1866 (*handing in the same*). I cannot give you the number of ashpits, but we paid last year 342*l.* for cleansing them, and we received 241*l.* 9*s.* 6*d.* from occupiers for the service.

10,921. That was a loss of 100*l.* 10*s.* 6*d.*?—Yes, which was chargeable to the rates.

10,922. Do you levy a charge upon owners for cleansing their ashpits?—Yes; we charge them according to the quantity of stuff removed.

10,923. Can they remove it themselves?—Yes, they can.

10,924. Do they remove it?—Those who remove it themselves are more connected with the agricultural and suburban districts; the farmers fetch it. If it remains and becomes a nuisance our inspector gives them notice to remove it, and if it is not done then we can do it, and charge the owners with the cost under the Public Health Act.

10,925. Is not all the refuse from ashpits and privies, as in Manchester and Liverpool, vested in the corporation?—No.

10,926. In those two boroughs and some others the whole of the refuse is vested in the corporation?—Yes, and that would answer in a very populous district, a city or town, but not here.

10,927. You act through the inspector of nuisances, and you can indict a person or clear away the refuse for him?—Yes, and charge him the cost of the work; that which is taken away by our own carts becomes the property of the corporation. Several gentlemen will come before you who will describe to you the state of their works and the state of the river caused by refuse of manufactories falling into it. I have not yet given you the storage of the reservoirs. The total capacity of our service reservoirs is 58,688,564 gallons exclusive of the Ogden Reservoir, which holds 220,000,000 of gallons, that being partially a compensation and partially a town reservoir. The total area of the gathering ground is about 1,240 acres. I will put in the Act of 1853 and also the Act of 1865 (*handing in the same.*)

10,928. Have you formed any opinion as to the sources from which water should, not be taken?—Yes.

10,929. You are aware that some towns in the district have been obliged to take water from the polluted river?—Yes; and I think it is very desirable that there should be a general measure passed for the purpose of placing the management of the rivers—say within the basin of the Calder—under the supervision of a conservancy board. Such a conservancy board should be represented by the various local bodies and water companies as well as corporations within the basin.

10,930. Would you have them constituted as an elective body?—An elective body. My opinion is that no town ought to be allowed to draw its water supply from the Calder proper for town purposes, and that the scheme would pay if all the property within the area of the Calder were to be taxed in order to buy up such water companies as now draw from the Calder. I have a table here giving the number of parishes in the basin of the Calder, the area and the rateable value. There are 13 parishes, and the total area is 151,149 acres, while the rateable value is 1,214,283*l.*

HALIFAX.

J. E. Norris, Esq.

16 Nov. 1866.

10,931. Do you think that would be a proper area from which to elect a conservancy board?—I think so. I would also suggest that if a general measure is passed to prevent refuse being thrown into these tributaries or rivers, and particularly tributaries, from towns and manufactories, each town should be compelled to send into the board of conservancy a plan of its proposed drainage, or its mode of dealing with the outfall or any sewage irrigation works. Then that the conservancy board should approve of that plan and submit it to the Home Secretary through the Local Government Act Office, for confirmation by a supplemental Act. It is very important that all towns should be placed in a position of security for the immense amount of money that they must lay out in these works; therefore I think that any plan which might be approved by the conservancy board should receive the sanction of Parliament.

10,932. In a similar way to a provisional order which now receives confirmation by being entrusted to the Home Secretary to lay before Parliament and carry it through?—Yes; I think that any plan proposed and sent to a conservancy board should be afterwards sent to the Home Secretary for confirmation; notice would be given, and parties who were interested and who might feel injured or affected by the proposed works would then have an opportunity of appearing before the committee to which such plan might be referred and of asking for clauses.

10,933. The proceeding would be something like an application for town or street improvements, they would schedule the property and serve notices as for a private Act and deposit the necessary documents with the clerks of the peace?—Or with the Town Clerk.

10,934. You send duplicates to the Home Office?—Yes.

10,935. A local inquiry is directed?—Yes.

10,936. And a report is made?—Yes.

10,937. Then a schedule is prepared and a provisional order is made?—Yes.

10,938. If that provisional order is not opposed it passes Parliament, as a matter of course, without any expense to the locality?—Yes.

10,939. If it is opposed it is sent to a select committee and must take its chance?—Yes. I think it would be very proper machinery to adopt for anything that may be done in dealing with rate-payers' money in these localities for drainage purposes.

10,940. At the present time I daresay you know that the law makes no provision for your going to Parliament?—None.

10,941. If you go as a corporation to Parliament, you go at your own risks and charges?—Yes.

10,942. Do you think that any arrangement can be made or security given that a scheme is *bonâ fide*, because there are reasons why that power has not been granted to corporations?—I think it is more from want of legislation than from any inherent drawback in applications of corporate bodies. Corporations are trustees for the district and of the ratepayers' money; it is not to be supposed that they will go to Parliament wantonly. I think that where an application has to be made by a corporation for towns purposes, they ought to be protected if they do not succeed.

10,943. Do you think it could be done in this way, that the Secretary of State for Home Affairs, or the Board of Trade, if a dispute arose between the body of ratepayers, and the municipal body should decide the matter, and that the party should not have the option of going to the Court of Chancery?—I think that that would be a very wholesome provision. I may mention an instance. In 1864 I advised the corporation, when going to Parliament for an extension bill, that they could not appropriate their funds for the purpose. Two gentlemen in the council then made themselves personally responsible to the bank for 5,000*l.* to cover the costs, on the risk of our getting our bill.

10,944. Do you think that is a right state of the law?—No, I think it is very unjust that it should be so, and applying your suggestions as to the dealing with the public drainage or any expenditure for a large town, it is very important, I think, that the cost of applications to Parliament should not be questioned after receiving the approval of some authorized Officer of State. Town clerks do communicate with each other, and to a certain extent there is united action, but there is very great difficulty in getting the heads of departments to take a case up; they say that it will form the subject of a General Act shortly; there are two or three things that we have been trying to get done. As to legalising bye-laws which are a sort of local Act of Parliament without the sanction of Parliament, any person can question the validity of those bye-laws if he thinks that they are repugnant to the common law or the statute law. We wanted the Home Secretary to pass an Amendment Act by which the bye-laws, after receiving his sanction, shall be considered as law, until they are brought to the Court of Queen's Bench and quashed on *certiorari*. It was considered a very desirable thing to be done, and we had a short bill prepared, but it was put on the shelf and we have heard nothing of it now for two years; we were told that the thing would have to be dealt with in a general measure. I think that in any general measure with respect to these rivers besides preventing traders and manufacturers from throwing refuse into them, there ought to be a stringent law to compel canal companies to cleanse out their canals also, and again, where rivers are navigable, the companies who enjoy the navigation should be charged with the dredging.

10,945. Do you not think that at present, parties engaged upon canals, navigations, and rivers, are compelled in self-defence, in order to carry on their own trade, to cleanse and dredge them?—Canals I think, are going back; they are not so flourishing as they were, and the undertakers are liable to neglect these things and allow the canals to become like duck-ponds instead of canals. I think it is necessary that something should be done so long as they remain canals; they ought not to be allowed to be nuisances; let people either keep them clean or abandon them.

10,946. (*Professor Way.*) Are not canals generally supplied with water from rivers?—Ours is supplied from the Hebble, so that our sewage water is pumped back into the town.

10,947. Would not the proprietors of the canals say that the filthy state of the river caused the canal to be in so unclean a state?—Yes, and they do say so; but still, according to the common law, they must not act so as to increase the nuisance.

10,948. (*Mr. Harrison.*) If steps are taken to purify the Hebble, and if, consequently, at the place whence they draw their supply the water is purified, will there then remain any objection to thus drawing water from the former source?—Not at all, if you get rid of the cause of the nuisance.

10,949. I see in the return you have handed in, that the amount paid for cleansing ashpits has increased considerably since 1852, how do you account for that?—In this way. We only became a local body under the Public Health Act in 1851, and our surveillance has been increasing. The increased amount is indicative of better supervision.

10,950. You have stated that there are only 960 waterclosets in the whole town?—Yes, at the present time, which are paying to us.

10,951. Are ashpits very common in the borough?—Yes, they are.

10,952. Do you intend to perpetuate them, or do you contemplate the extension of the watercloset system in the poorer dwellings?—At the present time the corporation being short of water do not encourage the watercloset system and will not do so till the new works come into operation, but we are very stringent in our byelaws as to the construction of ashpits and privies. I think among the cottage owners there is rather an objection to waterclosets because they are more liable to get out of order and become a nuisance

HALIFAX.

J. E Norris, Esq.

16 Nov. 1866.

than ashpits and privies, which are under a system of periodical cleansing. We have about 3,000 ashpits and sometimes a nest of privies empty into one common ashpit.

10,953. Have you experienced any beneficial effects from your water system as to fires in the town of Halifax?—Yes, we have fireplugs all over the town, and when a fire occurs we have simply to apply a hose.

10,954. Have you been able to extinguish a fire more rapidly?—Yes, the labour of working the engine under the old system was very great.

10,955. Has the saving of property been considerable?—Yes, we receive periodical reports from the superintendent of police showing the amount of property destroyed and the amount of property saved.

10,956. Have you had any estimate made of the value of the water power or the compensation you would have to make if the owners of watermills substituted steam power for their water power?—We have not had a valuation made. There is no doubt that in this town where coal is so easily procured of all kinds and for such large concerns as those which exist on these streams water power is of very little value. The total available fall on the Hebble is about 405 feet; that is from Bottom's Mill down to Salter Hebble.

10,957. From your experience in the sale of mills, what do you value that water power at per annum?—About 5*l.* per horse power is the rateable value of the appropriated falls.

10,958. Do you think that it could be bought up at that sum?—I do not know. I am afraid that our heavy penalty of 10*l.* a day is rather a bonus than otherwise, and that the parties would not like to part with their power; at least some of them might not, but I think that the majority of the mill-owners would act liberally in the matter, however we have not attempted it.

10,959. It is a question whether it might not be worth while to buy up all the water power in these valleys instead of going to a distance for further waterworks?—I think as a precaution we ought not to decrease the volume of water that comes down, even supposing we could send down that quantity for flushing and general sanitary purposes alone. It would be very desirable to form impounding reservoirs at the heads of all valleys so as to send down a greater quantity in dry seasons for flushing the streams.

10,960. What is the area of the Hebble?—I think the watershed of the Hebble is about 5,600 acres, of which 1,240 are now appropriated for the Ogden reservoir, and when the Mixenden reservoir is made we shall take 190 acres more.

10,961. What part of that area is above the town of Halifax?—The watershed above Lee bridge is 6218 acres, that is including the Ovenden valley.

10,962. You stated it would be desirable to prevent towns upon the Calder taking their water supply from the Calder proper?—Yes.

10,963. Would you apply that to the town of Wakefield?—Yes.

10,964. If you prevented them from taking water from the Calder, how would you make compensation?—I think that the whole of the basin of the Calder should be taxed for the purpose of buying up the pumping works at Wakefield. It is most desirable that Wakefield should be debarred from taking water out of the main drain of this district for its supply. I would tax the whole of the area of the basin of the Calder for the purpose of buying up those works.

10,965. Then they would have to go to another expensive source?—Yes, but you may be compelling us in the upper parts of the river to cease polluting the streams, and you may be putting us to expense in carting away the refuse which we now drain into those streams, and if we increase the volume of water to Wakefield and those who are below, I do not see why they should not be put in the same category and be made to seek water from other sources where they can get it pure. I consider that at Durnford bridge, from which point Dewsbury is supplied, they might lay a pipe on to Wakefield. I believe there is sufficient catchment to supply Wakefield, Dewsbury, and Mirfield.

10,966. How could Wakefield, taking water from the Calder, affect towns situated below Wakefield?—So long as there are existing rights above Wakefield, which you cannot possibly prevent, there must be a certain amount of pollution coming down the river—there is no doubt that from manufactories and other sources — from places with a large population like Wakefield—there must be some nuisance; I therefore think it most desirable that for their own sakes you should prevent the people below Wakefield from taking water out of the river.

10,967. And you think it would be fair to tax the whole basin. How far would you extend that?—Over the whole basin. I consider that the people living below Wakefield will be benefited by any general measure that may be proposed for the purification of the river in the same way as those above Wakefield will be; there will be one system which will be as fair to those above as to those below Wakefield.

10,968. (*Chairman.*) Would you base the taxation on the Poor Law valuation?—Yes; and borrow the money from the Loan Commissioners at 3¼ per cent., and extend repayment over a period of 30 or 40 years. I would collect it in the shape of a county rate as the poor rate is collected.

10,969. Is the county rate now paid out of the poor rate?—It is collected with it, and paid by the overseers of the poor.

10,970. An estimate is made, and the two are collected as one rate, and the amount required by the magistrate is paid out?—Yes.

10,971. And you would do the same thing with a rate for the prevention of river pollution?—Yes. I would adopt the same machinery. The rateable value of the whole of the basin of the Calder being say 1,250,000*l.*, the payment of say 50,000*l.* to buy up the Wakefield pumping works, would be a fraction of a farthing in the £ extended over 30 years.

10,972. (*Professor Way.*) Is not the acquisition of water power by companies to some extent a limit to the increase of population in the districts from which the water is taken?—No; I think not. If you take water from high sources, or from sources where it is totally unpolluted, and it comes down to those districts pure, you do not at all injure the district from which you take it.

10,973. You do not injure it as it exists, but when water from one district is taken to another, will it be possible for the supplying district to grow as it might otherwise have done?—The water is taken from a high uninhabited district.

10,974. If you rob one valley of water to benefit another, you might prevent the development of the first valley in its lower parts?—Yes.

10,975. You have stated that water is very much sought for in Halifax for manufacturing purposes?—Yes.

10,976. And that as population grew you found it impossible to supply the wants of trade to the same extent as before because more water was wanted for domestic purposes?—Yes.

10,977. Increase of population I suppose is dependent upon increase of trade?—Yes.

10,978. Will there not therefore come a time when increase of population will be checked if you diminish the supply of water for trade purposes?—To a certain extent that must be the case, but still if you take water from a high level I do not see why you should not impound it at the heads of the valleys included within the area of the supply, and so provide for the wants of the populations in those valleys.

HALIFAX.

J. E. Norris, Esq.

16 Nov. 1866.

10,979. Compensation is always estimated in reference to existing trade, is it not—arrangements for the future are not contemplated ?—No ; compensation is based on the minimum quantity of water passing down the valley from which you are seeking to carry it away.

10,980. The question is whether you should encourage the practice of taking water from the highest sources, if you are indifferent to the state of its purity after you have used it, and as it passes away from you through your drain. The Wakefield people now take water from the Calder, and if any remedy for the pollution of rivers could be devised, they would probably have purer water than they have now ?—Of course they would to a certain extent, but still the water of the Calder would be in a very unfit state for their consumption.

10,981. If you extend your collection of water to the highest sources you may be doing that which might not be necessary if the river could be kept clean ?—I do not think it is possible in manufacturing districts so to purify the water in rivers as to make it fit for town supply—that is for drinking purposes. Of course I do not know what chemistry may do. If you can purify sewage so as to make it fit for the public to use it, then I think the problem will be solved ; but if you cannot do that, then I do not think it will be possible to purify the waters of rivers so as to make them fit for use or safe.

10,982. I suppose you know that a large bulk of the water required for manufacturing purposes is used for washing, and that if water is moderately pure and free from sediment it can be used ?—Yes.

10,983. Is it not possible that by proper measures the water which comes from the ordinary streams of this district and others also may after use at manufactories be rendered sufficiently pure at the manufactories before it is allowed to leave them ?—Yes ; if you could keep out solid refuse and compel a system of filtration in the manufactories, then you might send the water comparatively pure into the stream and make it available for many purposes, such as washing, but such a law must be general and must apply to the whole country. It will not do to put a certain manufacturing district under restrictions and allow another district to act with impunity under the old system.

10,984. (*Chairman.*) Parliament has thought fit to grant Waterworks Acts in different parts of the country as in the case of Liverpool, which obtains its supply from Rivington, which is in another part of Lancashire, 36 miles away, and the growth of manufacturers has been so great about Blackburn that since the cessation of the cotton famine there has positively been a water famine. Mills are shut up and hands thrown out of employment. Do you think, if it could be shown in the case of Blackburn that a much better supply could be obtained from another district, it would be right and proper that that district should be deprived of water which is required for its own mill hands ?—That takes me back to my original position, that you may go into a water yielding district to the highest ground you can reach, and if the water is so abundant that you can impound it without doing any material injury to the persons living below you may so impound a great volume of pure water which would otherwise run away into the ocean; and serve both districts.

10,985. Do you think that Parliament would be better able to deal with these great questions if the country were divided into drainage areas and Conservancy Boards were established to take charge of those areas, and to study the question generally and also in its details ?—Yes.

10,986. So that when any fractional portion of an area was dealt with it should always be dealt with in reference to the whole area ?—All these valleys have their own specialities. I think that you must put large basins under Conservancy Boards, and those boards ought to study these subjects, as to dividing the country into districts for water supply, &c.

10,987. Are you of opinion that much mischief might be avoided if the control and management of a large area were placed in the hands of a properly constituted body ?—Yes ; that would be the object of a Conservancy Board.

10,988. Do you think that a large waste of money might be prevented ?—No doubt of it.

10,989. If the law were modified, great and useless expenditures, parliamentary contests, and local struggles might be avoided ?—No doubt of it. If the contemplated body had the power to give its approval to any scheme affecting the water supply of a particular basin, I think that all parties might be satisfied.

10,990. You would have a disinterested tribunal who would exercise an impartial judgment and whose opinion, if a question was referred to a select committee of the House of Commons, would have considerable weight with the members of that committee ?—Just so.

10,991. You have no doubt that such a system would prevent a wasteful expenditure of money ?—I believe it would have a very beneficial effect, but you could not get rid of difficulties altogether.

The witness withdrew.

JOHN CROSSLEY, Esq. (Halifax), examined.

J. Crossley, Esq.

10,992. (*Chairman.*) How long have you been resident in the town ?—I am a native of the place and so was my father before me.

10,993. Have you any statistics that would show the growth of trade in the valley of the Hebble ?—I can only say that the growth since my boyhood has been immense on all sides.

10,994. Do you think it has attained to the utmost limit that it is likely to ?—No, the trade is still growing.

10,995. And may grow to an extent that you would not venture to predict ?—Yes.

10,996. Does the growth of trade depend in any degree upon the water of the valley ?—It immensely depends upon the water. The trade of this town I have no hesitation in saying has been very much restricted and curtailed by the want of a large volume of water.

10,997. The growth of the trade of this district depends in a considerable degree upon the volume and purity of the water ?—Yes, purity also is a very important element indeed.

10,998. There are, I believe, two sources of supply, that which is impounded from surface drainage, and that which is derived from the strata by pumps and wells ?—Yes, and springs ; there are a number of springs which are scarcely ever dry, and which have been secured by the corporation.

10,999. Is coal worked to any extent in this valley ?—Very slightly indeed ; the bed of coal is very thin ; there is in the Ovenden valley a coal pit, and only one that I know of.

11,000. Where is the coal brought from ?—Principally from the Barnsley district, from the Normanton and the Wakefield districts and Brighouse.

11,001. You have a coal field adjoining, but the town is not situated upon it ?—No, it is the Halifax bed, but a very thin one; recently it has not been worked, I mean since railways and other kinds of communication have brought in coals from more distant parts.

11,002. Does the firm of which you are a member possess more than one mill ?—We have a number adjoining each other.

11,003. Where are they situated ?—In the borough at a place called Dane Clough.

11,004. On the banks of the Hebble or near what stream ?—They are on the banks of the Hebble.

HALIFAX.

J. Crossley, Esq.

16 Nov. 1866.

11,005. Do you use the water of the Hebble for power of any kind?—The original mill belonging to my father was exclusively a water-power mill.

11,006. Have you that mill still?—Yes, the water-wheel is still there of about 10-horse power.

11,007. What extent of steam power have you added to it?—We have added very largely indeed to it. I think there are six or seven engines each nominally of 60-horse power.

11,008. What amount of coal do you consume per annum?—About 27,000 tons.

11,009. Do you know what weight of ashes those coals produce?—The weight of ashes and other refuse material which are carted away is about 1,400 tons per annum.

11,010. What do you do with the other ashes?—All of them are carted away.

11,011. Your ashes would be about 5,000 or 6,000 tons I suppose?—Yes; I must be in error.

11,012. Would the ashes be one-fourth or one-fifth of the whole quantity of coal?—Yes, they are very considerable, it requires many carts to take them away.

11,013. (*Professor Way.*) Would the ashes be about 12 per cent. of the coal?—That would be very much nearer the mark; we have a great deal of rubbish and refuse.

11,014. You do not pollute the stream or obstruct it with your ashes?—We have been very careful about that. Many years ago we were, I may say, guilty in that matter; we put our refuse almost exclusively into the beck, and it was washed away, that lasted for a number of years, but we do not put any in now.

11,015. You cart it away?—Yes.

11,016. Have you the means of disposing of it, or is it a cost to you to cart it away?—Yes, it is a very considerable cost to us; we have been obliged to get space wherever we could; we have sometimes had to cart the rubbish two or three miles, but latterly we have met with some spare ground not very distant, and we have conveyed it there.

11,017. You make a spoil heap of it I suppose?—Yes; formerly we used to let the soapsuds go into the river.

11,018. At what cost per ton is the rubbish taken away?—To Leeds it costs us I think 1*s.* 6*d.*, or something like that.

11,019. What number of hands do you employ?—Of men, women, and children at Halifax, about 4,300.

11,020. What arrangement have you for privies?—We think we have a very perfect arrangement.

11,021. Do you pollute the river in that respect?—Not in the slightest degree. Take our sheds, for instance, we have a sort of long passage under a shed on which the soil is deposited, and during the night it is conveyed away by tramway to the extreme end of the shed for deposit in a tank, and from that it is carted away on to the land.

11,022. Land of your own?—Yes; and we sell a great deal of it; we turn it to account.

11,023. You can carry on your great works with your numerous hands without polluting the stream which flows past you?—Yes, we have not so polluted it for many years in the slightest degree.

11,024. What volume of water do you use on your premises?—What we raise by pumping ourselves from wells which we have sunk and drift ways which we have made (we have bored in all directions), what we pump from the river itself, and what we take from the corporation will altogether amount to something like 1,000,000 gallons a day.

11,025. In 24 hours?—Yes, for all uses.

11,026. How much of that do you take from the corporation?—At present they have restricted us; the fact is, we have not been able to get what we wanted.

11,027. If they could sell you more you would take more?—Yes; latterly we have not had more than about 8,000 gallons a day, but we have taken as much as 80,000 gallons a day.

11,028. For what purpose is that used?—For washing, or for dyeing, or printing.

11,029. Is that water pure and soft?—It is very nice and good water, excellent water.

11,030. About what volume do you raise from the river per day?—I have not got the particulars, but we raise a very considerable quantity; we also wash yarns with it. We use an immense quantity for that purpose, and the waste water is immediately discharged down the river in not a very much worse state than it was when it came to us. We must have a certain quantity to get the requisite purity.

11,031. Is the river water at any time objectionable?—We could not use what comes from the Ovenden stream at all; we take water from the Whitley stream, our works are just at the junction of the two.

11,032. Are there works situated upon those streams above you?—Yes.

11,033. Do they pollute the waters before they come down to you?—The water of the Ovenden brook is polluted to such an extent that it is perfectly useless to us.

11,034. If restrictions were put upon these manufacturers (assuming that it is found that they can carry on their trade beneficially without polluting these streams) would those restrictions be a benefit to you as a manufacturer?—Yes, a very great benefit.

11,035. Would you consent to be put under similar restrictions requiring you to send your water down to your neighbours as pure as you received it?—We should be glad to be shown the art and mystery of doing that.

11,036. If science can point out any means by which you can purify the water and yet carry on your trade without serious loss you would be glad to do so?—We should be delighted to do it.

11,037. Are there attached to the mills above you private reservoirs, or impounding reservoirs?—Yes, there are several.

11,038. Are there any attached to your mills?—We have had one.

11,039. What volume of water will it contain?—We have now covered it over with a shed, and it is very much circumscribed; it was a very large one formerly, I cannot say what size it is.

11,040. When any of those mill reservoirs become choked with sediment, which I assume they do, what is done?—In a time like this the owners would open their sluices and set a number of men to work to get rid of that deposit and flush it into the river.

11,041. Supposing that floods do not occur, do they ever flush out their reservoirs at other times?—Sometimes they do, to the great grief and annoyance and injury of the parties lower down.

11,042. Do you do a little flushing in your own reservoir?—We have done such a thing, but I think we avoid it; I am quite sure that we do.

11,043. You strive to do what you can?—Yes.

11,044. You are subject to pollutions which are caused by the flushings above?—Yes.

11,045. Formerly you did flush your own tank into the river?—Yes; but latterly we never do so unless in a very extreme time like the present, when our neighbours would not be injured.

11,046. Suppose this state of things, which will apply to many rivers. Say that a river is five miles long, and that there are 10 mills upon it, each of them having an impound reservoir attached to the mill, and each of them accumulating refuse. As the law at present stands, or rather as the practice is, the upper mill owner flushes his reservoir and sends the mud into the stream; the second catches a portion of it, and the third, the fourth and fifth, and so on, each in his turn does the same thing, each of them in flushing his own reservoir is benefited for the time being, and injures all his neighbours below?—Yes, that is really the case.

11,047. Does it not appear to you that if each of those individuals was compelled by law to dispose of what mud came to him in some other way than by passing it into the river it would be a benefit to all,

because although the first cost might be something considerable, each would derive an advantage by having less mud to deal with?—We should be very glad if such a plan of proceedings was enforced by law; however inconvenient it might be, we should be delighted to have it carried out.

11,048. Supposing that by your own arrangements you prevent pollution from watercloset, and also pollution by ashes, you would be also desirous of preventing pollution by accumulations of mud?—Yes.

11,049. Do you think that your good example would be so powerful, that all your neighbours above and below you would follow it?—I cannot say.

11,050. I am sure that you are aware that the example is not followed?—I know that it is not.

11,051. Can you state what volume of water you pump, and the cost of it?—I should say that nearly all or a very large portion of the water which is pumped up to be conveyed to pipes in our works, is afterwards used for washing and other purposes; but a great part of the entire water consumed, will be used for condensing purposes, and that is taken from the river direct to our engines.

11,052. What is the material that you use principally in your works?—Wool, cotton, and linen.

11,053. Can you state what is the annual weight of the three kinds of material that you use?—Our consumption of wool is close upon 400 packs a week, a pack weighing 240 lbs.

11,054. What weight of soap do you use?—Very large quantities. I cannot give you the precise quantities.

11,055. What becomes of the refuse water after the materials are washed?—I must draw a distinction between the washing of wool and the washing of pieces; when we wash wool we use soap, and latterly we have extracted the soap again.

11,056. You use soap and oil?—Yes.

11,057. What is the character and quality of the soap that is used?—There is hard and soft soap.

11,058. Can you give us any idea of the weights?—No.

11,059. What do you do with the refuse water?—The refuse from the wool-yarn washing we convey into tanks and extract the oily matter from it, and the result is, that comparatively pure water is passed down the brook.

11,060. Is that operation carried out by your firm?—Yes, it is.

11,061. Do you know what weight of grease you extract per week, or month, or year?—Something like two tons a week.

11,062. Is it worth about 18*l.* a ton?—Yes; that is about the price.

11,063. Do you sell the grease?—Yes.

11,064. What becomes of the sediment remaining after the extraction of the grease?—It is carried away.

11,065. And sold to the farmers?—I cannot say.

11,066. What weight is it?—I think the farmers do not quite like it, and that it is accumulating; we are obliged to destroy it in some way. I know that it is not taken away so readily as we could wish.

11,067. You do not carry it into the river?—No.

11,068. (*Professor Way.*) Perhaps it does not go direct to the farmers; it may pass through the hands of the manure makers?—We have tried it; my brother had some of it sent to his estate, and he has tested it; he does not find that there is any great commercial value in it.

11,069. The water that comes from the pieces goes away into the river?—Yes.

11,070. You cannot give the weight of that refuse?—No.

11,071. (*Chairman.*) Do you make your own gas?—Yes; a large portion of it, but not entirely; we take part from the corporation.

11,072. What becomes of the refuse that you make in your gas manufacture?—It is sold; the ammoniacal part is partly used by ourselves and partly sold.

11,073. Do you pollute the stream with anything from the gas manufacture?—No.

11,074. Do you suffer any injury from any gasworks above you?—I cannot say that we do.

11,075. Did you hear the evidence of the town clerk as to the form which future legislation might take with regard to river basins?—I heard most of what he said.

11,076. Have you at all studied the question of how the pollution of the river is to be prevented in future?—I have seen for many years that the evil is augmenting, as manufactories have been established upon the banks of our river. I can see the importance of attention being drawn to this matter, and I hope some plan will be devised for mitigating the evil; but I must say that after all the thought I have been able to give to the subject, it has appeared to me to be surrounded with great difficulties. I have been a member of the corporation for many years, and I know that the arrangements for the sewage of the town were laid down upon the basis of ultimately taking away the soil, or the injurious portions of the sewage, so as not really to pollute the river. The outfall was placed by Mr. Ranger very much upon the basis that something would be done to utilize portions of the town sewage; but the difficulty of disposing of dyewater discharged from our dyeworks, is a difficulty of which I must say I do not see any solution.

11,077. Did you see in this morning's paper an abstract of Mr. Ripley's evidence of yesterday, as given at Bradford?—I did not.

11,078. Do you accept the estimate of the annual value of the woollen manufactures of Yorkshire made by Mr. Ripley, as president of the Bradford Local Chamber of Commerce?—I should not be able to answer him, I am afraid, as to the figures, although I have had occasion to get up some statistics of that kind for this very district.

11,079. Have you any recollection what those statistics were?—I am afraid I have not.

11,080. Would you be surprised to learn that Mr. Ripley estimates the value of the worsted trade at something like 25,000,000*l.* annually?—Is that the entire worsted trade of Yorkshire?

11,081. The entire worsted trade of Yorkshire; the entire worsted and woollen trade of the United Kingdom is upwards of 64,000,000*l.* annually. If that enormous annual value is involved in the trade of the country, I assume that you would say that any regulations to interfere with it should be very carefully considered?—I should indeed.

11,082. That they should be considered with the utmost care and judgment?—It is of the utmost importance. Where such a large mass of artizans and working people are dependent for their means of subsistence upon trade of that magnitude, it must be self-evident that to interfere with it needlessly would be a very great crime. But something ought to be done to protect our rivers from the evils which, I am afraid, if continued in their present form, will be most injurious to health and to life. I am quite sure that the state of the lower part of this town at the outfall is a matter which requires very great attention.

11,083. The question is bound up with various considerations. First of all there is the health of the district, and then there is the trade; and those two considerations are mixed up with the present modes of carrying on the trade which result at present in a certain amount of injurious pollution?—Yes.

11,084. And the question will be how that pollution can be diminished so as to benefit the inhabitants in their health and not to ruinously affect the manufacturers in their operations?—That, I think, is the desideratum, and to get a solution for that matter is of vital importance.

11,085. Persons generally judge more from themselves than from what is without. You having regulated your own enormous works so as not to pollute the stream which passes by you, may not have turned

HALIFAX.

J. Crossley, Esq.

16 Nov. 1866.

your attention so exclusively to this question as we have been obliged to do. Would you be surprised to hear from this Commission that at present in Yorkshire over many scores of miles of your rivers all the ashes created at manufactories are poured in. If a new mill is to be built, and the river happens to be the nearest point, the material excavated from the foundations is wheeled in. In the case of highways bounding the district the handiest means of getting rid of the road scrapings is taken—they are carted and tipped into the river. Scores of dyers and manufacturers pour in every part of their refuse without attempting to purify it or to utilize it. From the intercepted soapsuds, taking Yorkshire generally, at the present time 100,000*l.* per annum is returned back to the manufacturers by contractors for being allowed to deal with that soap refuse which formerly polluted the streams, and the estimate is that at the present moment another 100,000*l.* value of grease in the form of soapsuds is allowed to go into the rivers and to pollute the streams?—Yes.

11,086 Do you think that it would be any hardship if a measure were adoped to compel (I use the word "compel" advisedly) the utilization of that soap refuse, both that which is already voluntarily utilized and is paying 100,000*l.* a year, and that which, if utilized, might pay another 100,000*l.* a year? You would say that you at great cost have to carry on your manufacture by carting away your ashes: do you think that any individual who is now passing ashes into the river should be allowed to do so on the plea that it would cost him money to cart them away or otherwise dispose of them, and that he had alway, been accustomed to do as he does now?—I should say that so far as regards the articles you have mentioned, soapsuds, ashes, road scrapings, and all those things, there ought to be power in the hands of the authorities of any given district, at once and without any delay, to put an end to that state of things. I very well remember the time on the stream where our works are situated when it was the universal practice to throw ashes into it. We did it ourselves, as our neighbours did it; and it was such an evil that the manufacturers associated themselves together for the purpose of common protection, and to prevent it. We had several lawsuits upon that point. A decision was given in one instance to our prejudice, and it was the means, I believe, of somewhat dispiriting and breaking up our association. It was in the case of a person on the Calder (for our association applied both to the Calder and to the Hebble) and judgment was given against us on the ground that the person pouring his ashes into the river had practised the thing for a period exceeding 20 years, and the judge ruled that as he had acquired this right he might continue so to exercise it; on that ground our association got a little discouraged. But in the valley in which our own works are situated all the manufacturers agreed, by giving their signatures, that they would cease to put in ashes, and I do not think that that is now carried on to any great extent, at all events.

11,087. That would be binding simply as regarded the number of firms signing that bond?—Just so.

11,088. It would not affect persons beyond the range of that bond either above or below you?—No.

11,089. Neither would it affect the other parts of Yorkshire?—No.

11,090. Therefore, although half a dozen or a dozen or any number of manufacturers might combine, it would still leave the great bulk of the offenders at liberty to pursue their own courses?—It would, and I think that it is a very great evil. I see constantly in other parts of the district that the thing is done daily and in open day, and I think that the sooner that is put an end to the better.

11,091. If the whole of the pollutions cannot be kept out of the river, do you think that we may anticipate, that through the assistance of this commission, Parliament may be enabled to legislate so as to prevent a vast amount of the existing evil?—I am perfectly certain of it.

11,992. And not to injure the trade of the district?—Not at all. I am quite sure that ashes, and a great variety of the injurious matter which is now allowed to find its way into the river, might with the greatest possible advantage be kept out of it, and as it has been done with soapsuds, so it is just possible that chemists may devise some means of utilizing some other injurious articles, and turning them to some practical account. But I am quite clear that so far as regards ashes, and a great variety of other things, we should be only too glad to be compelled to keep them out of the river.

11,093. Then as to sewage; you, representing a firm employing as large a number of hands as most of the great works in the Yorkshire valleys, have found means of utilizing the soil refuse from your population, and turning it, if not to a very beneficial use, yet to use, without polluting the river?—Yes.

11,094. If it can be shown that there are thousands and tens of thousands of individuals in works situated at no greater disadvantage than your works, the sewage of whom is carelessly passed into the running waters of the district to pollute the streams, as far as it goes down, do you think that we might say that others should do what you have done?—It is quite easy, and it is not only easy, but it is desirable and important that it should be done.

11,095. And it would not be an obstruction to your trade if you were put under restrictions to that extent?—It would not.

11,096. First, you might keep out the sewage, and it would not be an obstruction to your trade?—Just so.

11,097. And then you could keep out the ashes?—They might be turned to profitable account. We make money by them, but of course not a great deal.

11,098. The water containing chemical matter may raise a more difficult question?—That is a more difficult subject.

11,099. You pollute the water by the colouring matter, that is to say, by mordants of various kinds, by acids and by other matters which enter into chemical combination with the water?—Yes. That is a matter which is, I think, surrounded by a great deal of difficulty. I think that there is a great deal of dyewood which might be abstracted and not be allowed to go into the river in the way that it does now. In our case, we do not allow it to go into the river, so far as we are able to prevent it; we cart it away.

11,100 At present there are hundreds of thousands of pounds of dyewood, both chip and rasped wood, sent down the stream?—Yes; which ought not to go, and need not go.

11,101. Is your dyewood used in the chip form or in the rasped form?—Both.

11,102. And you can retain both kinds?—We can very largely. I think that the chip could be altogether kept out, and that the ground-wood could to a very large extent be kept out.

11,103. Can you in any way utilize the chips, or get rid of them by mixing them with the fuel?—We burn them.

11,104. You put them under the boilers?—Yes.

11,105. Is the rasped wood capable of being utilized in that way to any extent?—I do not think that it is, because it comes from the works in such a wet form.

11,106. And you cart it away?—Yes, we take it along with the ashes, and make spoil of it.

11,107. Have you had any demand in this valley for ashes by the Railway Companies?—We had during the construction of the railway, and we occasionally have now, but it is very rare; at one time it was a great outlet to us and a great convenience.

11,108. (*Mr. Harrison.*) Will you be kind enough to tell us the depth at which you pump the water in your well ?—I do not think that any of our wells are very deep, but it is a department with which I have not much to do ; perhaps 25 or 30 yards is the depth, but we have mined a good deal under our own property, and in that way we have got a very large amount of water.

11,109. Can you give us the cost at which you are for pumping the water ?—I am afraid that I could not speak with very great accuracy, but I think that it is under a penny per thousand gallons, or about a penny.

11,110. You have given us the weight of wool which you use in your works, can you give us the weight of cotton ?—We use I should think from 25 to 30 tons of wool a week, and I should think that we use cotton to the same extent ; perhaps not quite so much.

11,111. Can you give us the weight of oil which you use ?—I shall be happy to furnish you with all that information accurately.

11,112. Can you furnish us with the weight of solid dye woods ?—I shall be very happy to furnish that information.

11,113. Did you hear the remark of the Town Clerk as to the necessity for preventing the towns from taking their water supply from the Calder proper ?—I did.

11,114. Do you agree with him in his proposition that the town of Wakefield should be compensated by the whole of the area of the Calder for their water-works, so that they might be enabled to go to some other source for their supply ?—I am not prepared to say that I should exactly endorse that opinion. I think that a supply from the river in its present state is altogether out of the question for domestic use.

11,115. If the tributaries are not polluted in future as they are now, the Calder at Wakefield might be restored to a comparative state of purity, and not be an objectionable source of supply ?—So long as we have so many dyeworks on the line, and so long as that large body of water is turned from the manufactories into the river, I should very much doubt whether any town so near as Wakefield could with any kind of satisfaction use the water for domestic purposes.

11,116. Might not that question affect the towns below Wakefield more than the area of the Calder above Wakefield. It might affect Castleford, and Pontefract, and perhaps Goole. It might be an advantage to the town of Wakefield to be paid so much to go to another source of supply ?—If any one town comes in for compensation there were other towns along the line which I have no doubt would be very eager claimants.

11,117. (*Professor Way.*) If you now find a great difficulty in water supply, and if that difficulty increases for domestic purposes, the tendency of any measure for preventing impurities would be at the same time to make it easier for towns to be supplied with domestic water ?—No doubt of it.

11,118. Because the water which is now used for manufacturing purposes would be liberated ?—Quite so.

11,119. Therefore the point to aim at might possibly be to prevent impurity, instead of allowing impurity to be made, and then going to a fresh supply ?—Quite so.

11,120. At all events, I suppose that in your experience, water which is not so impure as the present streams and rivers in this neighbourhood which may not be fit for domestic supply, may still be fit for manufacturing purposes ?—Yes ; for condensing purposes, and if not very much polluted with dye-water, for dyeing purposes. The difficulty which has presented itself to my mind in keeping separate the dye-water, and passing it on without its being used for a considerable distance, is that those who have water power on the line, and to whom it is an object to have their wheels propelled, would say that this water was just as good for them as power as if it was ever so pure.

11,121. But you agree with the town clerk in saying that the water power as compared with the steam power of the district is very inconsiderable ?—It is very inconsiderable indeed. It is getting less and less, I think.

11,122. (*Mr. Harrison.*) In your own case I think that your water power is about 10 horse power ?—Yes.

11,123. Whereas the steam power which you have erected is 360 horse power ?—Yes.

11,124. For that 360 horse steam power which you have, what volume of water do you suppose you evaporate in the course of a day ?—About 120,000 gallons.

11,125. What would be the volume of water which you would use for your 10-horse water power ?—I am afraid to say.

11,126. It depends upon your fall ?—Entirely so. I really could not give you that information.

11,127. (*Professor Way.*) The chairman has very properly called your attention to the value of the woollen and worsted trade of the United Kingdom, which was represented to us as being something like 64,000,000*l.* per annum. A very minute percentage of that money would constitute a very large sum, would it not ?—I should think so.

11,128. The condition of this water, I suppose, is a very important item in the acquisition of this 70,000,000*l.* of money per annum ?—Certainly.

11,129. Could not that trade afford a reasonable amount of money annually for the purification of the water which they use ?—The great difficulty is in showing them how to purify the water.

11,130. Assuming it to be possible would not the interest of the trade itself bear a certain tax ?—I think that it would. It is such an evil that if it can be shown that by any remedy we can get rid of it at a small expenditure the proposition ought to be entertained.

11,131. Whilst the general public would benefit by the purification of this water would the trade itself benefit also by it ?—I have no doubt that individuals having mills and manufactories upon the line would be benefited by it.

11,132. (*Mr. Harrison.*) For instance, taking your own case. I think you said that you received from the Water Company, when they could let you have it, 80,000 gallons a day ?—Yes.

11,133. What did you pay for that ?—At the time when we used such a large quantity the corporation had an enormous supply, and they put down the price at a very low sum I think, 3*d.* per thousand gallons.

11,134. Would not that be about 1*l.* a day or 300*l.* a year even at that low price ?—It would.

11,135. If the brook had not been polluted as you say the Hebble brook is polluted, could you have obtained that volume of water from that brook for your purposes at a much less cost than that ?—We could have had it without any cost at all, for it would have been ready for pumping from the surface of the river.

11,136. In that case you have data by which you can reckon to some extent the cost to which you are put by the pollution of the river above you ?—Yes, I should think that we have spent 5,000*l.* or 6,000*l.* upon those wells alone. We have spent very large sums in acquiring properties higher up with a view to protect what is called the Ovenden brook. We have made an arrangement with one party who had a dyehouse on the stream and it has ceased to work, and we pay an annual sum in consideration of its not being started again.

11,137. Can you put those different items together and let us have them, so as to show what is really the cost to which you have gone in obtaining the pure water which you require for your manufacturing purposes ?—I shall be very glad to furnish you with all that information. We have been so hampered for the want of pure water that we have had to buy the thing up. We have bought lands and I think two mills higher up, and the right which was acquired by other parties upon the land.

11,138. If you put all those items together, they

HALIFAX.

J. Crossley, Esq.

16 Nov. 1866.

appear to come to a considerable sum?—They would do so.

11,139. And it would represent a considerable annual charge?—It would.

11,140. A charge much larger in all probability than any expenditure to which you would be put in purifying even your dyeworks?—I think that that is very likely.

11,141. (*Professor Way.*) You have spoken of the necessity of the pure water for your purposes. May we take it that for some part of your operations purity means cleanness, that is to say, that water without sediment in it and without colour would be sufficiently good?—Quite so. For some purposes we require water transparent and quite pure, that is for what we call steeping purposes; the object of steeping is to extract the brimstone out of the yarns, which are pure white, and any colour whatever, even of mere mud or sand, will be very injurious indeed—anything which would give the water any kind of colour.

11,142. But a water which was not chemically pure might be still pure enough for many of your purposes?—Quite so.

11,143. The water coming down the stream, from works above you, if divested of its absolute colour, might be fit for your purposes?—For many purposes we should use it extensively.

11,144. (*Chairman.*) Is there anything further which you wish to add?—I do not know that anything occurs to me. I have been very much pleased to learn that this Commission has been instituted, and I am looking forward with very great hope that some practical result may come out of it, for I am quite satisfied that the matter is one which really needed investigation, to say the least, in order that some measure, if possible, may be devised to remedy the evils to which the streams and the parties on the line are subject. I am very happy that the matter has been taken up in this way, and I hope that something may come of it.

The witness withdrew.

Colonel Edward Akroyd, M.P. (Halifax), examined.

Col. E. Akroyd, M.P.

11,145. (*Chairman.*) You represent the borough of Halifax in Parliament?—I do.

11,146. How long have you been engaged in manufactures in this part of the country?—Our first works in this neighbourhood were at a place called Bowling Dyke immediately above North Bridge; they consisted of a mill turned by steam power, originally 30-horse power. That mill was purchased by my father in 1817.

11,147. And I assume that it has been very largely extended since that period?—The space at Bowling Dyke is limited, but in other localities our works have been extended,

11,148. Have you been engaged with your father in manufactures since your boyhood?—Yes, my father migrated to Halifax in 1817 from Brook House, on the upper branches of the same stream.

11,149. Do you remember the condition of the stream at that period?—I do.

11,150. What was it as compared with what it is now?—Of course the river was very much purer at that time than it is now. I may state, in order to put the matter rather more in detail, that in 1817 the works above us on the stream were those of Messrs. Crossley, to which Mr. Crossley has already referred, and then above those I think there were upon the Ovenden beck the dyeworks of Messrs. Crossley, and subsequently the dyeworks of Messrs. Rawson. Then on the Wheatly beck there were the dyeworks of Mr. Irving. Our mill is situated immediately below that of Messrs. Crossley, a short distance below the confluence of the Wheatly beck and the Ovenden beck, which after their conjunction form the stream of the Hebble.

11,151. What is the special manufacture carried on in your works?—The worsted manufacture. Originally that manufacture was confined to goods made of wool exclusively. Within my own recollection, what is called the mixed goods trade has been introduced, one portion of the material being cotton and the other portion wool, and I believe that the first manufacturer to introduce it was my uncle, who had his works upon the same stream a little higher up.

11,152. What number of hands are at present employed upon your premises?—We employ altogether about 4,000 as nearly as I can make out; that includes adults and children, and short timers, but at one place, at Bowling Dyke, we have in round numbers about from 800 to 900 workpeople employed.

11,153. Do you use water very largely for your operations?—We use it for condensing purposes and for scouring wool.

11,154. What steam power do you employ at present?—At the mill at Bowling Dyke the nominal horse power is simply two engines of 45 horse power each, making 90 horse power, the actual horse power will be 380; that difference is the difference between the nominal and the actual horse power.

11,155. What weight of coal do you consume?—At Bowling Dyke about 2,500 tons per annum.

11,156. What amount of cinders result from the combustion of the coals?—About 400 tons, as nearly as I can make it out.

11,157. What becomes of those ashes?—In former days the whole of those ashes were thrown into the brook; they were generally placed at one side of the brook and left there for the chance of a flood like that which we have unfortunately to-day to sweep them away. I was one of the parties who joined the association to which Mr. Crossley has referred, and since that period we have carted all our ashes away, so that at present none of our ashes are put into the brook.

11,158. Do you know what it costs per load to cart those ashes away?—I think that you cannot fix a definite sum, because it depends very much upon the distance to which we have to lead the ashes. To my firm it was not very costly because we had an old quarry, a sort of hollow space, which we filled up in that way.

11,159. Then it costs you the expense of conveyance between your works and the quarry?—Yes; but as that quarry is pretty nearly filled up, the expense is rather greater now; it is a fluctuating sum.

11,160. But the ashes are taken away at a cost to yourselves?—Yes.

11,161. What arrangements have you for getting rid of the soil matter from the hands employed upon your premises; have you waterclosets?—We have both waterclosets and privies. Our mill has been extended, and in the new portion we have a cart underneath the privies. The mill at Bowling Dyke is built perpendicularly, it is not on the shed plan; it is a spinning mill, and the privies are arranged one above the other, the soil falls down a sort of conduit, at the foot of which is placed a cart into which the excrements fall; sometimes we put a deodorizing powder into it. That is one set of privies. The other set is in the nature of waterclosets, the contents of which fall into the brook. I was induced to try the waterclosets from the fact that the smell from the privies was exceedingly offensive, and found its way up to the door so that the workers very near the door of the privy were very much annoyed by the smell; in short, we found the privies a more objectionable mode as regards the workers than the watercloset.

11,162. But the watercloset, so far as it goes, tends to the pollution of the brook below you?—No doubt it does.

11,163. Have you seen any of the earthclosets which have been recently introduced?—I have heard a good deal of them, and I had an opportunity yesterday, which I regret I could not avail myself of, of inspecting the earth closets of the West Riding prison at

Wakefield. I understood from the governor, Captain Armytage, that those earthclosets had been working exceedingly well.

11,164. I assume that you are a magistrate of the county?—I am one of the visiting justices, and I attended the meeting yesterday in that capacity. In comparing the one mode with the other, allow me to say that in our waterclosets we have underneath an outfall pipe a sort of grating formed to catch all the more solid matter, the liquid matter finding its way through. I requested my engineer to make an experiment there of putting a small filter bed, having a layer of sand for a certain distance, so that the water falling through the pipe should pass into the filter, and by that means we shall be able to reserve all the solid matter.

11,165. I think that you have been a member of Parliament for several years?—I was member for Huddersfield from 1857 to 1859, and I was returned for Halifax in the present Parliament.

11,166. You have taken part in the Imperial Parliament in legislating upon the sewage question upon previous occasions?—Yes.

11,167. I think that you have served as member upon some of the Select Committees appointed to inquire into this very question of the utilization of sewage?—I served in 1858 on "The Select Committee appointed to take into consideration Mr. Gurney's Report on the state of the River Thames, and such other suggestions as they may deem it expedient to entertain for its purification, especially in the immediate vicinity of the Houses of Parliament."

11,168. You had evidence before you upon that Committee from certain persons who were supposed to have special knowledge upon those questions?—Yes.

11,169. One amongst the number was Mr. Lawes, the great agriculturist?—Yes; and I may say that Mr. Lawes's evidence was taken at my suggestion, made to the chairman, Mr. Kendall. I had heard a good deal of the mode adopted for purifying the stream which runs by Leicester, and I wanted to have evidence brought before the Committee as to the mode of purification so adopted, with the view of ascertaining whether that mode was applicable to the river Thames, and in fact generally throughout the country. I may say that as a member of the Committee I was quite satisfied that the mode adopted at Leicester was capable of application to the river Thames and elsewhere; and the only objection to that mode which I heard advanced was that the precipitation of the filtered matter was not serviceable for agricultural purposes—that is to say that the refuse carried away was not commercially valuable; but as regards the primary object, the purification of the stream passing by Leicester, the evidence proved that the result was perfectly satisfactory. In fact, so successful was the experiment at Leicester, that trout, of which formerly there had been a great many in the stream running by Leicester, and which had vanished long ago, after the adoption of this mode of deodorization, came back to the stream and found it fit for their habitation. In the evidence given by Mr. Lawes, which seems applicable to the terms of the present Commission, reference was made to 30 different modes of deodorization, one being that adopted at Leicester, where the purification of the water was carried out very much by precipitation by the introduction of cream of lime. Another mode was that adopted at Cheltenham by filtration, and a question was put to Mr. Lawes with regard to the comparative value of the residuum from these two processes. Mr. Lawes said that at Leicester the residuum was comparatively valueless. The question was put to Mr. Lawes which of the two plans he considered the best. Mr. Lawes said that he considered the Cheltenham system superior to the Leicester system. Then the next question was this, "Have they tried it as a matter of commercial speculation." The answer was, "Yes; and their information was this, that it nearly paid its expenses." That is the filtration mode at Cheltenham. "They there filtered the sewage and mixed the residuum with the ashes, the dust, and dry substances of the town, and sold it to the farmers at 3*s.* and 4*s.* a ton, and I think that if they could sell it for 5*s.* it would pay the expenses."

11,170. With regard to that experiment, have you found that the effluent water from those filtering tanks carries away at least 9/10ths of the fertilizing matter and that the sludge taken out mixed with the ashes bears a very small relative value to the whole value of the ingredients which are drained from the town. Since that report was made the farmers have grown a little wiser by experience, and they will not give the price which they were paying at that time?—Just so.

11,171. (*Professor Way.*) The Royal Commission appointed for the purpose of making inquiry divided the subject into two questions;—first, will the process pay, and secondly, if it will not pay what will be the expense. We considered our primary inquiry to be how sewage should be dealt with?—And that I presume is the object of the present commission?

11,172. It is not necessary to make the process a profitable transaction in order to deal with sewage?—Exactly.

11,173. (*Chairman.*) I presume that you have a copy of our present commission, if not I will pass one over to you. You will see what the terms of the commission are. It states; "We have deemed it expedient for divers good causes and considerations that a Commission should forthwith issue for the purpose of inquiring how far the present use of rivers or running waters in England, for the purpose of carrying off the sewage of towns and populous places and the refuse arising from industrial processes and manufactures can be prevented without risk to the public health or serious injury to such processes and manufactures, and how far such sewage and refuse can be utilized or got rid of otherwise than by discharge into rivers or running waters" (it says nothing about profit or loss but that the water is to be got rid of if it cannot be utilized) "or rendered harmless before reaching them; and also for the purpose of inquiring into the effect on the drainage of lands" and so on. You therefore see that the commission puts before us the question of utilizing the sewage if possible, and if not, of getting rid of it; and that in all cases it is to be done so that it shall not be injurious to the processes and manufactures carried on, but it is no part of our business to establish a case that sewage can be got rid of profitably?—But still if it can be got rid of profitably of course all the better.

11,174. If profit arises out of it so much to the advantage of every person concerned?—Yes. Referring again to the inquiry by the Select Committee, I may say that I instituted an experiment with a view to ascertain whether at the outfalls of the existing sewers an apparatus could be arranged to deodorize the matter, and to pass the water into the river comparatively clear. I do not mean to say free from liquid manure, which perhaps is hardly visible to the eye, but, at all events free from all offensive qualities.

11,175. To clarify it from the sediment?—Exactly: that was my object. I was in communication with Mr. Gurney, and at my request he prepared me a small model of a barge from the model of a barge floating on the river. At one end of this small model I got the very worst specimen of the sewage liquid matter from the London sewers which was almost as black as ink. This was put into a large vessel and let into the barge at one end by a tap. I subdivided the barge into three divisions, the first had a comparatively open mesh, the second was a very fine mesh, and the third partition was divided from the end by a narrow filter bed three or four inches wide; in the last division I introduced cream of lime and I allowed the sewage to flow through this barge. It came in at one end in this black state and it went out at the other end perfectly clean. My object was to illustrate the possibility of filtration of sewage or precipitation in a very small space, and to let the liquid matter flow

HALIFAX.

Col. E. Akroyd, M.P.

16 Nov. 1866.

through until the floating barge should be charged with semi-solid matter, with the view that when one barge was so charged you might pass another barge under the outfall of the sewer in the same way, and float the barges up and down the river, and get rid of the nuisance in that way.

11,176. If you have perused the report published by the commission, of which Mr. Lawes and myself were members, you have found that that commission adopted that same idea upon a very gigantic scale. We showed how the river could be embanked and how the interior of the embankment could be made a filter bed to intercept the sewage, and to let the effluent water pass into the Thames, and that the sludge could be worked up by a screw pump and passed into carts or barges. But although we were a Royal Commission employed upon that very question our suggestions were never noticed?—My impression certainly as a member of that committee was that when we were arriving at a most interesting portion of our inquiry showing the possibility of deodorization of London sewage, at a comparatively small cost, our inquiry was cut short. I am aware that the ostensible ground was that the Session was drawing to a close, but my candid impression is that influences were brought to bear upon that committee with the view of shortening our proceedings, and of getting a report which by no means coincided with my views, for the purpose of sanctioning this immense outlay for intercepting sewers. The whole system of intercepting sewers struck me as being radically bad, for it proposed to draw out of the Thames, say at the upper part of London, a very large quantity of water at point A. and to pass it down to point B., at Greenwich or wherever it may be, and thus the intervening portion of the river between points A. and B. might be comparatively desiccated. If you draw out a large portion of the stream, it is evident that at low water between A and B the volume of water will be small, and there will be a difficulty in the navigation of the Thames. And you only shift your difficulty, for I believe that the deodorization piecemeal is better carried on than when applied to a flood of sewage which must be a nuisance at the particular point where the outfall occurs.

11,177. Our present inquiry is to deal with the rivers and streams in Yorkshire, they are of very much smaller volume than the Thames?—Yes.

11,178. They will therefore bear loss of water with much greater difficulty?—That is true.

11,179. Water is necessary both for power and for use; supposing then that any body of engineers should take it into their heads that interception upon the gigantic scale which has been carried out in London is necessary, and should propose to take up the foul waters from the several points and to convey them down to some point below, thereby depriving the intervening portions of the river of a large volume of water, what sort of effect would it have upon the manufacturing industry of this country?—It is clear that unless you can obtain water from other sources you prevent the possibility of mills being erected at those parts of the stream which are dried up in that way, and so far you injure the prosperity of the locality.

11,180. You cannot with any advantage repeat the mode of purification which has been adopted for the metropolis, I mean a great intercepting system?—Certainly not.

11,181. It has been stated that there are rivers where if you intercept the polluted water you dry the stream, and in fact destroy the river?—That is perfectly true, and I am not sure whether many of our corporations are not going upon an erroneous process of dealing with sewage. The system of depriving the river of the liquid sewage is radically bad, for this reason, that you draw out pure water from your original stream and do not return the water to it. I will assume that the stream is perfectly pure, Messrs. Crossley have the first draw, and although their neighbours sometimes suffer, I know that they take every means in their power to prevent their neighbours suffering from the nuisance, but, for argument sake, I will assume that all their dyewater is passed by a separate sewer so as to leave the brook pure. We come next, and the stream does not suffer from us, but it suffers from dyeworks down below, and there are so many drawers that by the time the river gets down to the lower part no water is left in summer time. Of course in winter the case is different. Then what is the result? It is true that you maintain your river bed comparatively pure, but still you have to deal with this sewage matter; I can speak rather feelingly upon that point, because I am the owner of Copley Mills on the left bank of the Calder, near the outfall of the Hebble, into the river Calder. I have let some of the land which I have there to a farmer who has used the Hebble water for irrigation upon his land there, and by means of the irrigation he has obtained very large crops, but I have a number of tenants at Copley village, and I found in summer time several cases of fever, which in my own mind I traced very much to malaria arising from this irrigation. I immediately reduced his rent very materially, and said "You must stop for the future this irrigation, it is a "nuisance, and it affects the sanitary condition of the "village."

11,182. (*Professor Way.*) How often do you fancy that that water is used over and over again?—For condensing purposes it is of course used by every mill on the stream; of course there is no objection to that, and it is tolerably often used for dyeworks.

11,183. Supposing that there are 20 mills on the stream, if every mill diverted the water which it receives, the water would not get down below the third or fourth mill?—No. Every time that the water is used for dyeworks, it gets worse. My own impression is, that this pollution of water should be dealt with exactly as we deal with the smoke nuisance, namely, that the party making the nuisance should get rid of it in some way or other. Of course, the objection naturally arises in old works. "How shall we find space for so doing?" especially upon the very excellent plan recommended by Mr. Ripley of Bradford, of subsidence; but I believe, that by filtration, and by the precipitation by lime, though objectionable in an agricultural point of view, you may restore the water even of towns, comparatively pure to the original stream. Only yesterday I got some of the water of the Hebble and made experiments with it. Passed through a common filter it did not come out perfectly clear, but when filtered with animal charcoal it became perfectly pure. From the rain which we have had, the water was not so dirty as usual, but I have been informed by others who have made these experiments, that you may make dyewater comparatively clear, so as not to be injurious to your neighbours, so as to be fit to be used for washing goods and for other purposes. If you can devise some process by which, in a short space, you can clarify this discoloured dyewater, you get rid of the whole difficulty and you throw the responsibility upon the parties who cause the nuisance. There are three ways in which you may do it; the first is subsidence, which requires a certain amount of space, and in some dyeworks there may be difficulty in getting space; the second mode is filtration; a moderately sized tank will be sufficient. The third mode would be the chemical one of precipitation to which many object, because you destroy the value of the products for agricultural purposes. But my impression is, that by a combination of those means you may purify the water, or restore it to a comparatively pure state. Then we come to the remaining question of the outfall of sewers. I believe that the mode of intercepting sewers is a false one; you may be apparently taking what is your own, but you injure all the property in the neighbourhood, and you injure the future development of that locality, and you are injuring posterity in order that the present generation may get rid of a local nuisance. Therefore, I believe, that the sound principle is, for the corporations to deal with the nuisance at the outfall of the sewer. As a practical man, I am satisfied

that it is quite possible to do so. We had it proved before the Sewage Committee on the Thames, that at Leicester the process of deodorization is not a nuisance to anybody, and that the water restored to the brook is comparatively clear. If it be possible, I say by all means put the saddle on the right horse, and let those who make the nuisance get rid of it. Let the outfalls of the sewers be where you carry on your deodorizing process, and I believe that by that means you may get rid of the whole difficulty.

11,184. (*Chairman.*) With regard to the irrigation which you complained of, was the land irrigated by sewage or by refuse water from manufactures?—It was irrigated by the river Hebble at its lowest portion near the canal basin, that is in its worst possible condition, for the Hebble becomes almost a sewer at that point.

11,185. You say that your farmer produced heavy crops by irrigation, but that you think that it was a source of nuisance, so as to cause fever?—There is no question that the crops were most luxuriant; he, I think, cut two or three times during the year. I found that during one season there were several cases of fever at Copley, more than usual. I have, myself, found the smell objectionable when I have been down there, and I was informed by the medical authorities, that the fever arose very much from the bad smells from the liquid sewage thrown over the land; and when I told the farmer that he must discontinue the process, he said that I must alter the rent, and I reduced the rent.

11,186. This question, as to the sanitary effect of irrigation, is one of a much wider bearing than this inquiry; it is most important; and if we have information of its being noxious which can be substantiated, it is our duty to act upon it; and if we have information which cannot be substantiated, it is our duty to declare it so. I wish to ask you a few questions with regard to this mode of irrigation. Have you yourself examined sewage irrigation works in other parts of the kingdom?—No.

11,187. You have not seen the Edinburgh meadows?—No.

11,188. There a very coarse system of irrigation has been carried on for two centuries, and charges have been made against that irrigation that it produces fevers; but searching investigations have been made, both with regard to some government barracks situated near, and with regard to the population resident around, and the result was that the irrigation was found not to have caused fever. Have you seen the Croydon meadows?—No.

11,189. The sewage of Croydon is poured upon certain meadows about a mile and a half from Croydon?—May I ask whether that is sewage matter?

11,190. The population of Croydon is about 30,000, and there the watercloset system is exclusively adopted. The whole of the effete matter from those 30,000 people passes into the sewers, and passes into the outlet, and the local authorities have an opportunity of putting it over something like 300 acres of land, but they put it over in sections of 20 or 30 acres at a time, about 1,000,000 gallons a day?—I can quite understand that that water is not injurious, it is very different from the Hebble.

11,191. Again at Worthing, with a population of 7,000, all the houses have watercloset, and the whole of that sewage is pumped, and has been for something like two years upon the land?—That I can understand. There is this distinction; the Hebble contains not only sewage matter but chemical matters, and it was proved in the Thames inquiry that in that case you create a sort of fermentation, and you raise certain gases which are most offensive to the smell and injurious to health. Sewage matter in a liquid state (as you have it at Croydon and elsewhere) I do not imagine would be very offensive, because most probably it might be taken up rapidly by the earth.

11,192. I have seen all the irrigation processes carried on, and I have yet to see the first example of malaria arising from such a cause?—I can understand that if you have one patch of land where you have sewage simply, and have it regulated, and if you have another patch of land where water containing chemicals is put, the result may be beneficial; but if the two are brought together into one stream I can understand what the result may be.

11,193. If the chemicals produce wholesome grass you may depend upon it that the objectionable matter is gone?—Before the committee on the Thames it was proved that the sewage matter floats on the top, and that the saline matter from the sea when it came into contact with that sewage matter caused fermentation. Some of the witnesses said that the fermentation which was so offensive in the Thames in 1858 was very much caused by the contact of floating sewage matter with saline matter from the sea.

11,194. (*Professor Way.*) Sewage matter proper has not a very enormous amount of sediment in it, but your manufacturing sewage, namely, the discharge of your sewers and brooks and streams in this district contains a mass of solid matter, and it is not improbable that plants may be smothered with the excess of deposit matter which in that case is thrown upon the land, but if the mode which you suggest of dealing with the impurity of the water were put in force, that is, if each manufacturer were compelled to keep out his refuse matter, the sewage would be ordinary sewage?—No doubt of it, but there would still remain certain chemicals in solution, and you cannot by filtration deal with chemicals in solution.

11,195. A remarkable thing about this district is that the amount of chemicals used has prevented the rivers from being anything like so bad as they might have been?—Yes.

11,196. (*Chairman.*) The Professor means to say the chemicals you use in your manufacture, so far from being injurious, act beneficially in preventing the effete matter of the population from being so poisonous as it would otherwise be there?—Yes.

11,197. (*Professor Way.*) The water supply at Wakefield is taken below the town just after the sewage is discharged; but when that water has subsided without any treatment whatever, it is a remarkably pure water as compared with the ordinary water of the town?—It was proved before our committee that sea water is specifically heavier than the sewage water. We had a beautiful experiment in which the sea water was, I think, coloured pink, and the sewage matter was black. By putting them into a glass vessel we found that the sea-water was invariably under a superstratum of sewage matter. It struck me that the water restored to the brooks from our dyeworks would also contain an amount of matter in solution which would be specifically heavier than sewage matter, and these two coming into contact might produce a certain amount of fermentation which might be injurious in a sanitary point of view.

11,198. There is no doubt that the mixture of sewage with salt water produces far more mischief than the mixture of it with fresh water, but that is believed to be due to the fact that the gases in the sewage are thrown out because they cannot be absorbed in water already saturated by salt. It is beyond doubt that Brighton and other seaport towns have suffered more than some inland towns. Your waters are not anything like so bad or so charged with chemicals as to go to that extent?—I should like the experiment to be repeated.

11,199. (*Mr. Harrison.*) How many acres of land have you in disposition near the junction of the Hebble and the Calder to which you could apply sewage?—Probably 20 or 30 acres.

11,200. Do you find any difficulty in passing the water from the Hebble on to that land?—No; the Hebble is considerably elevated above this meadow, which lies between the railway and the river.

11,201. Besides your property which you have mentioned, is there any extent of property similarly situated to which sewage might be applied?—Our works are on the left bank of the river, forming a sort of half-moon, bounded by the railway; on the

HALIFAX.

Col. E. Akroyd, M.P.

16 Nov. 1866.

other side of that railway there still remains a similar meadow which is not my property, and which is let by another party to the same farmer who holds mine, and where the irrigation process goes on in summer. I have observed that the process is very offensive in summer. The farmer gets very large crops from it. I am just reminded that there is a good deal of other land in that locality which is irrigated in the same way. The town clerk will be able to point that out better than myself.

11,202. Do you suppose that there are a few hundred acres to which sewage might be applied?—There are probably about 80 or 100 acres altogether.

11,203. Lower down the Calder is there any extent?—Yes, the land lies a little more favourably higher up the stream. Of course irrigation must be very much confined to the level bank or the sloping bank on the side of the Calder.

11,204. Under present circumstances is the land flooded?—Yes, the whole of the village of Copley is flooded, and the lower cellars are all filled with water at this very time.

11,205. (*Professor Way.*) Your principle is prevention rather than cure, is it not?—It is.

11,206. Just as a certain amount of cleansing, if continually carried on, will keep a building or a room clean?—Yes. I will assume for argument sake that all the chimneys in Halifax were taken into one smoke duct, and that that smoke duct was carried up to Beacon's Hill (an ingenious method which was started by a townsman of mine some years ago) it would be more difficult to deal with that vast volume of smoke than if you required that at each chimney the smoke should be purified.

11,207. (*Chairman.*) You would never know who was the rebellious subject if all were directed into one?—Just so. You must throw the burden in the one case on the whole town, and in the other case you could throw it upon the individual.

11,208. As far as practicable it will be advisable that each individual shall, upon his own premises, prevent the pollution of the stream which he uses and which flows past him rather than to attempt any combination of numerous manufactories, for the evil may not be so easily dealt with in mass as in detail?—Exactly so.

11,209. Do you use much soap at your mills?—Yes, a good deal.

11,210. You use both soap and oil?—Yes.

11,211. Do you know how many packs you use?—We may be able to give you the figures in the aggregate, but I am afraid that I cannot give you the amount used at Bowling beck.

11,212. Do you utilize the soap waste?—We do not do as Messrs. Crossley do, namely, extract the grease ourselves, but we dispose of the liquid produce to Mr. Gann and I believe that it is carried down to his works which are lower down the stream than ours, and he separates, I suppose, the fatty matter and restores the purified water to the river.

11,213. Would it be fair to ask what you are paid for it?—About 160*l.* a year; that is not merely for the Bowling Dyke soapsuds but for all.

11,214. (*Mr. Harrison.*) Does not all the refuse from your manufactories eventually run into the Hebble?—No, we have one set of works at Copley on the Calder, and in the borough of Halifax we have two sets of works. The weaving establishment lies on a much higher level than the establishment at Bowling Dyke, the lower one.

11,215. Can you give us the total weights of wool and cotton and flax which you use at all the works, and the weight of dyewoods and other insoluble matters?—We do not use any dyewood, we have no dyeworks of our own, we give all that work to be dyed by the dyers. With regard to wool I can only give it to you in round numbers. I can get you the information. I am not prepared to furnish it now. You want to know the total weight of wool and soap and oil used.

11,216. Is the soap refuse utilized from both your works?—From both the works at Halifax, and from Copley.

11,217. (*Chairman.*) I may state to you that the reason why we are asking you so minutely as to the soap used and the wool dealt with and the other ingredients is, that Professor Way may have all the necessary elements for consideration, and when he gets samples of the refuse as it comes now from your works, and of the effluent water from the works where soap-waste is treated, it will be his duty to see whether chemistry can teach how profitably any important saving can be made, or how the material can be dealt with in any other way than that in which it is now dealt with?—I shall be most happy to furnish you with every information in my power to assist the Commissioners in any way. The only water fouled by us is that arising from the soapsuds.

11,218. And which you now pass on to another party?—Yes, where it is purified by a process which of course Professor Way thoroughly understands. We have no dye wares of any sort.

11,219. If you compare the weight of the oil and soap expended upon your works, and the weight and value of the matter recovered from the soap refuse, you will find that they differ very materially; the inference is that a great proportion of the material passes away after all that you have done at present to intercept it?—I am obliged for the hint, and if you will allow me, before the Commissioners leave Halifax, I will give you a tabular statement furnishing all the information for which you now ask me.

11,220. Would you have any objection to filling up a printed paper if we should think it necessary to send one, asking for answers to these questions?—I shall be most happy to furnish the information, and it may be interesting in this point of view. I think that we are almost the largest consumers of long wool as compared with short fibre wool. The Commissioners must bear in mind that the trade of this district is a very mixed one; the trade of the Bradford district is chiefly in mixed goods, compounded of wool and cotton; but in Halifax you have the carpet trade, to which Mr. Crossley has referred, and you have furniture goods such as the curtains round this room and elsewhere, in which cotton is rarely used, therefore, those returns may be doubly valuable in that respect.

11,221. We have received the most valuable assistance from all the parties who have tendered their evidence, and we shall very probably find it necessary to frame a set of questions, and to send them out as circulars. You in the kindest possible manner have promised to fill in any circular which we may send, and I only mention it to say, that we shall be extremely grateful if other gentlemen connected with the trade who have given evidence, or who have been prevented from giving evidence, will do the same. We do not want to be inquisitive, but only to render the commission as practical as it can be?—I think that it is the duty of every manufacturer to furnish every information in his power, without any idea that it will be used prejudicially. I think that it is important to impose no conditions upon dyers, or others creating this nuisance, which cannot be easily fulfilled. Assuming for argument sake that it is possible to deodorise or purify dye water, it would be very hard to require a dyer who had too limited space to carry out such an operation. But it is my notion that this process can be carried on in a very small space, by tanks one above the other or in various other ways, and it is upon those grounds that I venture to throw out the suggestion.

11,222. You have mentioned the case of Mr. Ripley at Bradford; he is one of the largest dyers in Yorkshire; his works are carried on with an abundance of space about them on land which is his own property; he has certain tanks into which the refuse dye water is passed, and then the solids are abstracted from that water, and he is enabled to use or sell that water to several manufacturers below him. But there are scores of dyeing premises in Yorkshire which the

mass would be obliged at once to shut up if you said to them "Go to Mr. Ripley and do exactly as he does or you shall not carry on your trade?"—I have often observed the three reservoirs of Mr. Ripley where he carries out his plan of subsidence, and of course for that process you require a large area. The suggestion which I ventured to throw out was as to filtration and precipitation which may be carried out in a small space; but where the dyer has room for subsidence I believe that Mr. Ripley's plan may be the best.

11,223. But in that case you would have to present to the manufacturers or dyers an alternative scheme. You would say "There is one mode by which one "gentleman gets rid of his refuse; there is another "mode by which another gentleman gets rid of his "refuse;" and then the Professor might say, "I "believe that I have ascertained that you can dis- "charge this matter by another process which will "occupy so much space, and I recommend that to "your attention."—I have said that I would deal with this nuisance as with the smoke nuisance. For getting rid of the smoke there are 20 or 30 patents, but the Legislature very properly does not require the parties who create the smoke to adopt any particular mode of getting rid of it, but all that it does is to insist upon the purification of the smoke, and that it shall be completely harmless, and not opaque. Therefore if you apply the same principle to the water, you must declare that the water shall be comparatively clear.

11,224. Do you prevent smoke from your works?—We have endeavoured to do so; we have tried various ways.

11,225. Have you tried a patent?—We have tried Jukes's patent, and a variety of patents. There is a very great difficulty in dealing with patents, but I am quite sure that smoke may be dealt with. I noticed your remarks, Mr. Chairman, upon that subject at Bradford, and I think that Mr. Ripley stated that if you had an engine heavily burthened you must create more smoke than with one lightly burthened. I believe that he was quite correct in that remark. I believe that one mode of getting rid of smoke is to have sufficient boilers. I quite concur in the opinion of the chairman that a great deal may be done by firing. I saw eight or ten years ago Messrs. Ashton's system at Hyde, they had eight or ten boilers all in a row, and very little smoke came from them, the coals being thrown first on one side and then on the other; there was sufficient space there, and there was an abundance of oxygen to mix with the smoke and to get rid of it.

11,226. As a gentleman considerably concerned in manufacture and making some smoke in the district, and knowing the contamination of the atmosphere and that the goods in your premises are injured by the smoke, do you think that we have arrived at a period when it would be judicious to enforce smoke prevention regulations?—I should be most thankful if they were introduced, for I am a great sufferer from it. I have a very pleasant residence, but in the front of that residence, when the wind is in certain directions, I cannot breathe the air of heaven with any pleasure; sometimes the smoke comes in a dense volume from dyeworks near me. Therefore, I think that in all manufacturing towns it will be found that the public at large would be very glad to afford assistance in dealing with the smoke nuisance and the water nuisance.

11,227. With regard to smoke prevention (smoke burning as some term it) I am at issue with you upon one point. I think that when you are working your boilers there is a loss to you during the time that the fire is deadened, so as to produce smoke, and that you are putting an injurious strain on your boilers in alternately lowering the temperature and then getting up intense heat, for that process expands and tends to weaken the boilers. If, even with small boiler space, you compelled your firemen to fire at shorter intervals, and always to fire in the front of his boiler, you might work that boiler and get as much steam out of it, without making smoke, as you do now, and perhaps a little more steam power than when you make those dense volumes of smoke. Smoke is entirely the result of either ignorance or idleness, or both?—You will allow me to point out how far I agree with you, and how far I disagree with you. I perfectly agree with you that it is a false economy to overload the boiler and to have too thick a fire upon it. The amount of heat derived from a given quantity of coal, and the amount of steam raised, are much less with a great quantity of fuel on the fire than with a thinner stratum. But, nevertheless, if you have only one boiler, and must raise a given amount of steam in a certain time, it is perfectly clear that you must keep throwing on coals to raise the heat. It is true that if you throw the coals on all at once you lower the temperature till those coals are burnt up; but the fireman must be almost perpetually throwing on coals, and every shovelfull of coals thrown on causes smoke, and the amount of smoke caused thereby is much larger in proportion when the boiler is overburthened than when there is abundant space.

11,228. But space is not a ruinously costly thing—that is to say, if you have twenty nominal horse-power working, it does not occasion a very ruinous cost to put up a thirty-horse boiler?—The outlay will pay you a better interest than endeavouring to carry on the work by one boiler, I think that that is a false economy.

11,229. If the Legislature said, "You shall not work with a boiler which is forced beyond its capacity, but shall provide yourself with a boiler capable of doing its work?" there would be no great hardship?—I should say certainly not.

11,230. You say that it would be economy?—A man sometimes may be short of capital.

11,231. (*Mr. Harrison.*) You know the cells in the prison at Wakefield?—I do.

11,232. If they have earthclosets in cells where prisoners are confined during the whole day that is about as severe a trial as a system of that kind can be put to?—Undoubtedly.

11,233. So that if it is successful there you may take it for granted that it would be successful in your manufactory?—I presume it to be so; I have not fully informed myself upon the *modus operandi*.

11,234. What quantity of water do you use at your manufactories, and where do you receive it from?—We use about 400,000 gallons, I think, per diem at Bowling Dyke. I am confining my remarks to one mill, which is on the Hebble; that is the quantity which we use for condensing purposes. I believe that we get about one-half from the brook and one-half from the reservoir.

11,235. From what reservoir?—We have lately purchased land for the purpose of forming a reservoir; we have laid out about 3,000*l.* in reservoir space, which perhaps would have been unnecessary if the water had been perfectly pure. The reservoir to which I refer is our own reservoir.

11,236. Deriving your water from those two sources, I suppose that you have no occasion to pump?—We have a pump besides that; I can hardly state the exact quantity of gallons which we get daily from our own pump.

11,237. Do you receive any water from the corporation?—No; we have the advantage of being on the Hebble, the works on the higher ground, of course, receive a good deal of water from the corporation. At present, by reason of the brook and from our natural advantages we can dispense with the necessity of taking the town's water, which I may say is most excellent, and I believe superior to what we use ourselves. I am reminded that we use some portion of the town's water for washing wool, for which soft water is a very great advantage; that water is very superior to the water which is derived from the wells, which is hard. The town's water is not to be beaten in England; it is excellent water, and there can be none better.

11,238. That, of course, is a great advantage to the town?—It is an immense advantage.

HALIFAX.

Col. E. Akroyd, M.P.

16 Nov. 1866.

11,239. When the corporation can bring a greater quantity into the town, do you think that it will be used to a much greater extent?—A good deal of the town of Halifax lies above the level of the stream. When we first purchased the mill property in 1817 there were no mills above, but there are now mills on the upper plateau, all of which require water, and I believe that the supply of water will give the town a new start in its manufacturing career, and that more attention will be paid to its manufacturing prosperity.

11,240. It will also tend to the healthiness of the town by giving water to parts in a more elevated position, and where steam power is used manufactories may be scattered over the surface of the ground, and not compressed into a small space as must be the case when the brook is the only source of supply?—That is true; there are mills on the high ground where possibly in former days the idea of mills being erected was never dreamt of. We receive town's water at other mills than Bowling Dyke, and we also have sources of our own.

11,241. So that you have comparatively little pumping?—Yes; we have pumping in the lower part. We have driven a bore under the hill, and have taken a good deal of water from it.

11,242. Do you find that the supply from that source varies in volume?—Yes, occasionally, in a very dry season we have pumped the source dry.

11,243. That is not the source upon which you depend?—We are sometimes obliged to do so, failing the other sources.

11,244. At your works upon the Calder where do you get your supply?—Partly from a private well and partly from the river.

11,245. (*Chairman.*) Did you hear the remarks which were made by the previous witnesses, Mr. Crossley and the town clerk, as to the future management of the river basins of Yorkshire, under a board of conservancy?—I did, and I am quite in favour of such a board, assuming that you would have some central office in London, like the Board of Health, which would control these various boards, or which at least would be in communication with them, furnishing them with all the information required.

11,246. Do you think that from the conservators, whoever they might be, there should be an appeal to one of the Government offices, either the Board of Trade, or the Home Office, or to the Privy Council?—Exactly.

11,247. The manufacturers might settle amongst themselves, I suppose, which, in their opinion, it should be?—Certainly. I think that rivers administration should form a separate department. I think that the Home Office already has more than it can do.

11,248. Then there is the Board of Trade?—That would hardly answer.

11,249. Then there is the Privy Council?—You must have a distinct board; one more nearly allied to the Board of Health than any other.

11,250. The Board of Health is a department of the Home Office?—Yes, and this might be a department of the Home Office. All I mean is that it should not come under the general duties of the Home Office, but should form a distinct department.

11,251. But attached to one or other of these Government departments?—Yes; I think that you might with great advantage put smoke and water under one board.

11,252. Are you acquainted with the Act known as the "Alkalis Manufacturing Act?" Lord Derby, some two or three years ago, obtained an Act to prevent the pollution of the atmosphere by gases from alkali manufacture?—I know that there is such an Act, but I do not know much of it.

11,253. In the whole country around alkali works vegetation was being destroyed by gas sent out, and the owners of these works were put under restrictions not to pass away from their chimneys more than 5 per cent. of this refuse?—Yes, that is so, I believe.

11,254. They are under some inspection similar to the factory inspection, and since that period they have carried on the manufactures, complying with the Act of Parliament, and going very far beyond it, scarcely turning out any injurious gas from the chimney?—I have had some rather unpleasant experience of those chimneys at the works of Messrs. Crossley. There was formerly a hanging wood of beeches on a property belonging to my late father, and now belonging to my brother, and these trees being rather low, nearly all were destroyed. Messrs. Crossley, quite conscious of the injury they were doing, went to great expense in raising the chimneys, so that we now suffer no injury at all from that cause.

The witness withdrew.

Mr. J. Richardson.

Mr. John Richardson (Halifax) examined.

11,255. (*Chairman.*) You are engineer to the borough of Halifax?—Yes.

11,256. How long have you held that appointment?—Since April last.

11,257. Where were you engaged before?—I was city surveyor for Gloucester.

11,258. How many years were you so employed?—Two years,

11,259. Where were you engaged before?—For five years I was surveyor for the Barnsley Local Board of Health.

11,260. How long have you been engaged in sanitary works?—Since 1859.

11,261. Under whom were you articled?—Mr. Brooke, of Huddersfield. I was in practice for eight years before I held the appointment at Barnsley.

11,262. Upon what points are you prepared to give evidence?—I have a paper (*handing in the same.*)

11,263. What is the water-shed of the Hebble?—The water-shed of the Hebble amounts to 8,318 acres. There is a tributary of about four miles in length, and I have given you the area of the two.

11,264. What is the length of the valley?—I think upwards of nine miles.

11,265. What is the present condition of the Hebble?—The present condition of the Hebble is this: it is very much polluted with the sewage of the district and with the refuse from manufactories; and I should say, from an examination that I made of the river, that its bed must have risen considerably within the last 20 or 30 years.

11,266. Do any of the manufacturers beyond the borough throw ashes into the river?—I believe so; but beyond the borough there are very few mills.

11,267. Do you know of any mills the owners of which pass ashes into the stream, or any other kind of solid refuse?—I cannot point to the mills, but I know that, especially on Saturday afternoon after the mills have ceased to work, they do pass down a considerable quantity of refuse,—ashes, and other matters.

11,268. By flushing out their private dams?—Yes.

11,269. They take the opportunity between Saturday and Sunday night to get rid of that matter by throwing it into the stream?—Yes.

11,270. In your opinion does that tend to raise the bed of the stream?—It does.

11,271. Is that liable to be injurious to the property on the banks?—I think so.

11,272. What is the rainfall in the Hebble valley?—I have the result of nine years' observations of the rainfall at two places near Mixenden, a little below our storage reservoir.

11,273. Give me the largest rainfall and the smallest?—The maximum rainfall was 48½ inches in 1859, and the minimum was 31·4 in 1855, the average being 38·6.

11,274. Can you give it me in the same way in any other district?—At Warley Moor, upon which our works are being constructed, during 12 years the maximum rainfall was 59·8 in 1853, the minimum was 35·9 in 1864, the average being 47·8. On Ovenden Moor (the Ovenden is one of the tributaries of the

Hebble) during 12 years' observations the maximum rainfall was 57·2 in 1856, the minimum 35 in 1865, the average being 46·5. On the Midgley Moor, where there is another portion of our extended works, the maximum rainfall was 55·4 in 1863, the minimum 39·5 in 1864, the average being 48·35. In the town of Halifax observations made during 37 years give a maximum rainfall of 41½ inches during 1830, a minimum of 23·64 in 1864, the average rainfall for 37 years being 32·06.

11,275. (*Mr. Harrison.*) The maximum rainfalls appear to have occurred in different years?—Yes, that is so, and I was much struck one year with the difference of rainfall at two places which were about on the same level and within a very short distance of each other.

11,276. (*Chairman.*) What form of rain-gauges do you use?—The funnel-top form.

11,277. Without a spindle?—Yes.

11,278. Of ten or 12 inches in diameter?—10 inches in diameter.

11,279. How often are your gaugings registered?—Monthly.

11,280. How often are they examined?—We keep a man exclusively to look after these things. I have several other observations as to the flow of the Hebble and the flow of the sewage from the principal outfall.

11,281. Will you give us the flow of the water down the Hebble at any particular point, giving the maximum and minimum?—I will give you first the flow from the outfall sewer.

11,282. At what point is that?—The outfall is near to Water Lane nursery, that is the principal one; then there are six minor outlets.

(The further examination of this witness was postponed.)

The witness withdrew.

Mr. Frederick Smith (Halifax) examined.

11,283. (*Chairman.*) Are you a resident in Halifax?—Yes.

11,284. What business do you carry on?—I am a wire manufacturer.

11,285. Where are your works situated?—About 100 yards above the level of the beck on the banks of the river.

11,286. How many men do you employ?—Something above 100 men and boys.

11,287. What horse-power do you employ?—50.

11,288. In wire drawing?—Yes.

11,289. What weight of material do you deal with per annum?—About 1,500 tons per annum.

11,290. Do you use water?—Yes.

11,291. Where do you obtain it?—Entirely from the town supply, the reservoir.

11,292. What volume do you use in a week?—A little over 2,000,000 gallons per annum.

11,293. What do you pay per 1,000 gallons?—10*d.*

11,294. What weight of coal do you use?—2,500 tons per annum.

11,295. What amount of ashes do you produce?—About four or five cartloads per week.

11,296. What do you do with them?—We cart them all away, none go into the river.

11,297. Have you any waterclosets or privies on your premises?—Three.

11,298. Does any refuse from these flow into the river?—Yes, all of it.

11,299. Have any complaints been made by your neighbours below?—None whatever.

11,300. Do other manufacturers do the same?—Yes, I believe they do.

11,301. What material do you use in your business besides iron and water?—We use a large amount of sulphuric acid and muriatic acid, about 90 tons in a year.

11,302. For what purposes do you use those acids?—For cleaning the wire from the oxide; the iron gets a little rusty in the raw material, and we take the oxide off with sulphuric acid.

11,303. What do you do with the waste acids when they have served their purpose?—They become largely impregnated with oxide of iron and they are turned down a drain into the river.

11,304. Is that waste liable to be injurious?—Quite the reverse I think; I believe that oxide of iron a good deal mixed with lime water is rather a good disinfectant or deodorizer for an impure stream.

11,305. Do you do anything at all to prevent smoke from your premises?—Nothing, except by careful firing.

11,306. Do you make much smoke or otherwise?—We do not make much, we have not been complained of.

11,307. Is it not possible to fire so carefully as not to make much smoke?—Certainly.

11,308. When you see a dense volume of smoke emitted, should you say that it was from small boiler room or bad firing?—I should think it was both combined.

11,309. Might you not have much smoke made where there was plenty of boiler room?—Yes; but if so it would be in consequence of injudicious firing.

11,310. Do you not think that there might be a small volume of smoke even with small boiler room by firing carefully?—Where you have small boiler room it is a difficult matter to prevent smoke.

11,311. Are you at all annoyed by the pollution of the stream above you?—Not at all; we get all our water from the town. Perhaps this acid when it gets into the stream would be mixed in the proportion of about one gallon with 125 gallons of water.

11,312. How many grains of iron do you suppose there would be in a gallon?—I cannot exactly say, but not very many.

11,313. Do you know what is per-chloride of iron, that is used for disinfecting?—I do not know much about it.

11,314. (*Mr. Harrison.*) You would have a considerable amount of sulphate of iron?—Yes.

11,315. Do you know that there are works established within the valley of the Aire and Calder to procure sulphate of iron?—I do not.

11,316. At Wakefield I believe there are some. Are you aware that sulphate of iron is an article of commerce of some value?—Yes.

11,317. What is its worth per ton here?—I do not know.

11,318. Have you ever taken any steps to separate the sulphate of iron from the water that is used?—None whatever, we never thought it would be of any use.

11,319. Are you aware that it is done?—Not in our trade.

11,320. I believe the crystals are worth 3*l.* or 4*l.* a ton?—I am not aware of that; and I am afraid that we should have more trouble in doing it than it would be worth.

11,321. (*Chairman.*) Do you not think that you could concentrate the acid by using the same water until you saturated it?—No, we cannot use it after a certain point, it will not act upon the iron. We have large stone cisterns, they are not made of lead, these are filled with hot water and sulphuric acid, and they are worked as long as it is necessary to clean the oxide of iron. After two or three times we let off the liquid, we pull a plug out and let it go. Only a very small portion of sediment would come from a ton weight of wire.

11,322. Your iron I suppose is the best iron?—Yes, we use Swedish iron in great measure, and we use the best English charcoal.

11,323. (*Mr. Harrison.*) What is the cost of the acid that you use?—Between 400*l.* and 500*l.* a year.

11,324. What do you lose in weight of 1,500 tons of iron?—We make a great deal of waste, little bits, that

HALIFAX.

Mr. F. Smith.

16 Nov. 1866.

we sell to the copperas manufacturers; we should make I think about 15 or 20 tons of waste in broken pieces in a year.

11,325. How much wire would you make from that quantity?—About 1,470 tons of wire, and of the oxide acting upon the surface of the wire, there would not I think be left above one or two pounds per ton.

11,326. (*Professor Way.*) I suppose the object of cleansing the wire is to coat it?—No; when it comes to us it is sometimes in a rusty condition, and we have to clean off the rust before we can draw it. After we have cleaned it with sulphuric acid we steep it in water, and after that we coat it with lime water.

11,327. I understand that you have a wire of a certain thickness, and you have to convert that into wire of a smaller thickness?—Yes.

11,328. And to clean off the coating of oxide you use sulphuric acid?—Yes, and muriatic acid.

11,329. By dissolving the exterior coat of iron, the oxide is thrown off?—Yes.

11,330. The oxide is dissolved in the acid?—Yes, in the acid and water.

11,331. Then you do not get a clear liquid?—No, certainly not, the oxide settles with the water in the cistern.

11,332. You get a coat of oxide of iron discharged from the iron by the action of the acid on the surface?—Yes.

11,333. It shells off?—Yes; it comes off quite clean.

11,334. When you use hydro-chloric acid it is partly one action and partly another; you dissolve part of the oxide of iron and part of the metal?—Yes; we use muriatic acid because its action is quicker; sulphuric acid does not take off the oxide so soon, and it requires the iron to steep in the acid for too long a time; for some purposes we use muriatic acid as being preferable to sulphuric acid.

11,335. Suppose the rust of iron is wanted in any large quantity, how is it to be obtained?—I think we could supply it with our waste wire, which is always exposed to the weather in far greater quantities than it is wanted. It is in small thin pieces of wire, which are as rusty as an old horseshoe.

11,336. If I wanted to make a large quantity of per-chloride of iron, where is the per-oxide of iron to be got to do it?—I do not know.

11,337. Do not you produce a very large quantity of per-oxide of iron in an insoluble state?—Yes, but it runs down the stream.

11,338. If a demand occurred for it could you stop it?—Yes, we could if we placed the outlet from the tank a little above the surface of the bottom; the water would run out and we could take out the oxide of iron.

11,339. What is the weight of iron that comes into your premises and the weight of manufactured goods that goes out?—1,500 tons.

11,340. The difference would arise from the oxidation?—Yes, and still more from the waste broken pieces, small bits, as long as my arm, or perhaps 30 inches in length, are continually broken off and accumulate, we have tons of them that we scarcely know how to get rid of, as rusty as possible.

11,341. Supposing all the oxide of iron which you now throw away, and which is an injury to the streams, was actually wanted to purify the streams, could you take any steps to collect it?—Yes, I think we could.

11,342. I need not ask you whether expense is incurred in oxidizing iron?—Of course there is.

11,343. Hydro-chloric acid is cheap, and you could make the per-oxide of iron cheap?—Yes.

11,344. The discharge which passes away is partly oxide of iron in mechanical suspension, and partly protoxide of iron or green vitriol?—Yes, and spent sulphuric acid.

11,345. What effect has that upon the stream?—Rather a beneficial one, I think. Much lime water is mixed with it also. We put the wires into cisterns and boil the liquid, and the stuff which comes out of the cistern is considered a good disinfectant. Oxide of iron and sulphuric acid, in their effect upon sewage manure I think are rather beneficial.

11,346. Are you aware that iron has been used to purify sewage at Cheltenham?—Yes.

11,347. And at Coventry?—Yes.

11,348. And that it really does precipitate the sewage in a prompt and successful manner?—Yes.

11,349. If the sewage be precipitated in the river, I presume the solid matter remains in the bed to be washed away by the stream?—Yes, of course it does.

11,350. If you had to deal with such a question you would rather take these things and mix them in proper proportions, than pass them into the river and trust to chance for the result?—Yes, of course.

11,351. (*Mr. Harrison.*) Do you find that the iron in the bed of the river consolidates the gravel and other matters thrown into the river to any extent?—I do not think it does.

11,352. Are your works similar to those which are carried on in Sheffield?—No. There are four other firms in the same trade, and therefore you can calculate the amount of this material which is used.

11,353. (*Chairman.*) What effect would restrictions have upon you, if you were prevented from passing your refuse water into the river?—It would be a very serious disadvantage if we could not let it off when we liked.

11,354. Would it interfere with your manufacture?—Entirely so. At the bottom of the cisterns we fix pieces of wood for the sediment to settle between, so that the wire does not touch the solid material; and after we let the water off we clear the sediment out. It is very nasty stuff; we have great difficulty in getting rid of it, for when we put it among the ashes, sometimes the railway people object to take it.

11,355. Supposing that no interference was used with regard to fluid refuse, would the circumstance of your being compelled to keep out solid refuse from the stream be of serious moment?—Not so serious a matter as a prohibition from passing fluid away.

11,356. You have to remove ashes, and if you could not turn your other solid refuse to any profitable use, your having to remove them would not destroy your trade?—No; but we would rather get rid of them as we do.

11,357. If all other persons were to be restrained from passing solids into rivers, should you wish to be exempted?—Certainly not. I should not object to any scheme that was made universal, so long as we were able to pass the liquids down.

11,358. (*Professor Way.*) Are you not discharging a large quantity of iron in the shape of oxide of iron and sulphate of iron into the river, for which, if a demand should spring up, you might obtain an income?—If that was to occur, we should be glad to adopt some means of intercepting the refuse, but I am afraid there would be no demand for it in the condition we make it.

11,359. If your neighbours were compelled to deal with their sewage and their manufacturing refuse and salts of iron was one of the means to be employed, is it not possible that you might be saving a great deal more than you would be losing?—Yes, certainly.

11,360. Do not you think that in many cases the value of a material is not found out by its possessors?—No doubt of it.

11,361. Take the case of tar and gas refuse, until it became compulsory to keep them out of rivers, there was no use for them, but the very necessity that compelled persons to keep them out of rivers directed attention to their use, and they are now found too valuable to be thrown away. May it not therefore happen in the case of your products that if you were prevented from throwing oxide of iron into the river, you might derive a great advantage from that circumstance?—Yes, we should be glad to find that that was the case.

The witness withdrew.

Mr. WILLIAM IRVING HOLDSWORTH (Halifax), examined.

11,362. (*Chairman.*) Do you carry on business in Halifax?—Yes, we are worsted manufacturers.

11,363. Where are the works situated?—Within a short distance of the town, at Shaw Hill.

11,364. Upon the banks of the Hebble?—Yes.

11,365. What number of men do you employ?—About 3,000 people.

11,366. Do you employ water power, or engine power, or both?—We use engine power exclusively.

11,367. What amount of horse power?—230.

11,368. What weight of coal do you use in a year?—About 25,000 tons.

11,369. What amount of ashes do they produce?—A very large quantity of ashes. I cannot exactly say the weight, but a considerable quantity of ashes is produced at our establishment.

11,370. Do you pass any ashes into the river?—We do not.

11,371. How are they removed?—All our ashes are carted away by our own carts to various places; the great bulk of them go to the railway and on to the roads in the district.

11,372. Do you use water for your manufacturing purposes?—We do.

11,373. To what extent?—We do not consume very much of the corporation water as we have private pumps of our own; for condensing purposes we take all our water from the canal.

11,374. You take a small quantity from the corporation?—Yes.

11,375. Do you know what the volume of that is?—According to a return that I have had from the office it appears to be somewhere about 10,000 or 11,000 gallons daily.

11,376. What price do you pay for it?—9*d.* per 1,000 gallons.

11,377. What volume do you lift from your wells?—I cannot say; perhaps 500,000 gallons a-day.

11,378. Do you dye upon your premises?—We do not.

11,379. Do you wash goods?—Yes, we wash the wool, using soap.

11,380. What weight of soap do you use in a year?—I cannot tell you the weight.

11,381. Do you do anything with your soap?—We use very large quantities of soap, and we dispose of our soapsuds to a manufacturer who manufactures on our premises.

11,382. How long have you disposed of your soapsuds?—For many years.

11,383. What weight of wool do you deal with in a year, or is it exclusively wool?—We use wool, cotton, and silk, but wool is the principal weight. The consumption of wool varies with us according to the state of the trade in the district, the largest consumption is generally at the rate of 300 packs per week.

11,384. What arrangement have you in the shape of waterclosets or privies for the work people?—In the mills and warehouses we have between 60 and 70 privies, and the refuse is all carted away into tanks.

11,385. It is not passed into the river?—Not at all; we have a few waterclosets, six or seven, connected with the works, the sewage from which finds its way into the Brook.

11,386. Do you use river water for any purpose?—Not now; we did in former years.

11,387. For condensing purposes you take water from the canal?—Yes, we do. I think we occasionally take a little water from the Brook with a small donkey-engine for the purpose of cleaning out the boilers, and we find the Brook water advantageous in that respect as dye water, and things that come down the Brook agree with our boilers much better than the canal water.

11,388. Have you any reservoir room or tank room on your premises?—No, nothing of that sort.

11,389. How long do you remember the river Hebble?—I remember it for the last 25 years.

11,390. What condition is it in now as compared with what it was when you first knew it?—Considerably worse, it is more impure.

11,391. Do you think that the bed of the Brook has been raised opposite to your premises since you first knew it?—I think there is not much difference in that respect, not near us.

11,392. What state is the river in to-day with this flood?—There is an enormous quantity of water coming down, in fact, the Brook is almost overflowing.

11,393. Are you liable occasionally to damage from it?—Yes.

11,394. If the bed of the Brook has been raised by accumulations, that would tend perhaps to damage you?—Yes.

11,395. If the bed of the river was lowered, you would be less liable to that?—Yes.

11,396. If there are parties above you who fill up the Brook by passing in solids, they are injuring your property, especially in a time like this?—Yes; we suffer not much inconvenience from the Brook, because we do not use it ourselves, but no doubt all these solids being thrown in tend to fill up the bed sooner or later.

11,397. In warm, dry weather, do you suffer any inconvenience from the smell or the stench of the Brook?—Yes, we do suffer very much; during the last two years, which have been dry seasons, we have suffered very much indeed.

11,398. You have been annoyed at your works and in your offices?—Yes, we have.

11,399. I suppose you would be glad if the Brook could be improved, and that state of things remedied?—Yes, certainly.

11,400. Do you think that the nuisance has been caused by the refuse dye water that has been passed in, or by sewage or both?—I should think from both. Of course I have watched the Brook very narrowly since the corporation turned the sewage into it, and there is no doubt that a greater nuisance exists now than before. Unfortunately for us the drain comes in just above us, and in a dry season we experience a great nuisance from it.

11,401. Does the outfall sewer empty itself above your works?—It does.

11,402. At what expense do you pump your water?—We have a separate pump for it, and the power is derived from the engine.

11,403. From the boiler which is doing the other work?—Yes.

11,404. What depth are your wells?—The principal one is about 25 yards.

11,405. Does the head of water vary at different seasons of the year?—It does.

11,406. When is it at the lowest?—I cannot exactly say. We have never suffered from a dry well, even during the two years drought, but the supply was not in the same quantity then as we have had it at other times.

11,407. Are your wells bore-holes?—They were formerly made for other engine power that we had in various parts of the works, but they were afterwards altered and converted into wells from which to pump water, to wash wool with and various other things.

11,408. Of what diameter are they?—Not very large, about six or seven feet.

11,409. Have you driven headings as Messrs. Crossley have—they have wells, and Mr. Crossley stated that they had driven headings or galleries into the stratification to intercept and bring in more water?—No; I believe that in one or two cases we have made a little headway of that sort.

11,410. Have you bore holes?—Yes.

11,411. To what depth do they extend from the surface?—I do not know.

11,412. Nor the diameter?—No.

11,413. So far as your experience goes, they have served your purpose in giving you water at all times?—I cannot say that they have served our purpose, but they have served a certain purpose which relates only to a very limited portion of our business; the great bulk of our supply comes from the canal and from the corporation.

HALIFAX.

Mr W. I. Holdsworth.

16 Nov. 1866.

11,414. What do you pay to the canal company for water?—We have three distinct sets of engines; two of them are within the prescribed distance allowed by Act of Parliament; the other is without that distance, and for that we pay 20*l.* annually.

11,415. Do you use the canal for traffic purposes?—Yes; we get a great quantity of coal by the canal.

11,416. You are a customer to the canal, and they accommodate you?—Yes.

11,417. You pay for that accommodation?—Certainly.

11,418. What is the quality of the water that you pump from your wells and bore holes?—It is hard water, much harder than the corporation water.

11,419. What makes it hard?—That I cannot say.

11,420. Has it any iron in it, so as to be objectionable to you?—Not at all.

11,421. It is not a chalybeate?—Not at all.

11,422. It does not affect your goods?—Not in the slightest degree.

11,423. Do you know the condition of the streams throughout Yorkshire generally?—I know that they are not so good as they ought to be. I know that most of them are very bad.

11,424. Do you think it is advisable to put any restraints upon manufacturers, who, at present, pass solid refuse into the rivers; such as ashes, and dye-woods?—I think it would be desirable to do so, as I do not see any very great difficulty in dealing with the solids; the treatment of liquids are a very difficult question.

11,425. Would you consider it a great hardship if you were compelled to keep out the refuse from your two or three waterclosets, if it could be shown that you could do so with some comfort and convenience to yourself?—We should be very glad to be shown any scheme that would improve the condition of the stream.

11,426. Although it would entail a few shillings of expense?—We should not object to that, if it was beneficial to the public.

11,427. Have you ever seen one of the newly-invented earth closets which have been introduced into Wakefield Gaol?—No.

11,428. If an earth closet can be placed in a cell 10 feet square, and the inmate can use it the year round without injury or nuisance, should you consider that a means of getting rid of the nuisance that may arise from waterclosets?—Not having seen it, I could not venture to offer an opinion about it, but any improvement of that sort we should only be too happy to adopt.

11,429. What amount of income do you derive from your refuse soapsuds?—I know it is under 200*l.* a year.

11,430. (*Mr. Harrison.*) Is it dependent upon the quantity of soap you use?—No; we have let it to a man who manufactures on the premises; he had a long lease some years ago, and he got it very reasonably; he pays so much per annum, and we engaged to send him all the suds.

11,431. (*Chairman.*) You do not trouble yourself as to what he makes?—No.

11,432. Nor whether you get an equivalent for what it is worth?—We think that this man has it too cheap now; he has had a long lease of it.

11,433. Do you manufacture your own gas?—Yes.

11,434. Do you pass out any refuse?—No; we pass nothing into the brook.

11,435. If any person who manufactures gas, pollutes the river with the refuse, I suppose you would say he ought, very fairly, to be prevented from doing so?—Certainly. I see no necessity for throwing anything from gas into the brook.

11,436. You can sell the ammoniacal liquor and the tar?—Yes; and we do so.

11,437. The coke you can consume under your own boilers?—Certainly.

11,438. (*Mr. Harrison.*) Have you ever made any calculation as to what it cost you to pump the same quantity of water that you might obtain from the corporation?—No.

11,439. If the water in the brook was pure, would you require to be supplied with that water which you now pay for to the corporation?—If it came down the brook pure and good enough for our purposes, we could save 20*l.* a year by taking it from the brook; it is within the distance of our engine, but we are not large consumers of the corporation water; we just simply take it for wool-washing because it is much softer than our own.

11,440. In an economical point of view, water is so valuable a commodity that it is important to you and other manufacturers that the pollution of rivers should cease?—Certainly, if it can be done without injury to the trade of a district.

11,441. If you were put to some expense to prevent it you might receive a *quid pro quo* by the purification of the river because you would be able to use the water;—Certainly.

11,442. (*Chairman.*) Do you use any apparatus for preventing smoke from your furnaces?—No; we adopted smoke-burners many years ago, but we had to discontinue them because we thought them very inefficient, they did not answer the purpose. Since then we have adopted a simpler method, which we think will be very good. We have erected one large chimney in the place of several others, and we have turned our smoke into this chimney. We place down about four or five additional boilers, we have always two or three over and above the regular work, and we make comparatively little smoke in consequence of that alteration.

11,443. What kind of fuel do you use, coal or slack?—We use two sorts of coal, one is small engine coal and the other is a larger kind, of a better class, and they are mixed together.

11,444. What is the cost per ton?—We pay now about 7*s.* 6*d.* a ton.

11,445. The coal is of a good quality which you expect easily to fire with without making much smoke?—Yes.

11,446. Have you tried the plan of throwing the onus of not making smoke upon the fireman?—Yes.

11,447. If you paid him a portion of his wages on the understanding that he did not make smoke, and if he did that you would deduct that portion, do you think that that might have the effect?—We have not put it in that way.

11,448. If you did so it would be no cost to you on account of the saving?—Unfortunately in these districts firemen are not so plentiful, and we cannot change them so easily.

11,449. A cheap man is the dearest person you can have about the premises?—No doubt of it.

11,450. Have you heard the opinions expressed by the previous witnesses as to the future conservancy of the river?—No.

11,451. Do you think that if the management were spread over the entire basin some beneficial measure might be carried out which should be useful to the whole of the manufacturers?—I have no doubt that the subject can be dealt with in such a way as to cause some improvement, more or less. What that may be time must show, but no doubt a very great improvement can be made.

11,452. You do not now put any ashes into the river?—No, but it was the common practice many years ago to do so.

11,453. Ashes went in with other manufacturing refuse when the mills were first established?—Yes.

11,454. You now cart them away as a matter of self-preservation?—Yes.

11,455. If there are other parts of the country where manufacturers throw ashes into the streams as you did formerly, do you think it would be ruinous to trade if they were prevented from doing it?—Certainly not, and I think that that is one of the things which ought to be dealt with at once.

11,456. If other parties abuse the rivers by throwing in solids, such as foundation materials or road scrapings, do you think that they ought to be prevented from doing it?—Certainly; there is no doubt that

there is a large amount of matter which goes into the brook that ought never to go there, and there ought to be some restriction placed upon that.

11,457. If you cannot utilize or clarify the dye water, you may, I presume, prevent the dye wares which are used from going in by intercepting them?—I should say so, either by burning or taking them away.

11,458. (*Mr. Harrison.*) Did you hear what Colonel Akroyd stated, which was that he pays so much, not merely to keep back the dyewoods, but that by precipitation with lime and filtration, the water from dyeworks may be sent out in almost a pure condition?—That is going beyond what I could say, because I really have not studied that part of the question; as for the solids I do not hesitate to say that they could be kept out without the slightest difficulty.

11,459. (*Professor Way.*) If the rasped wood was of value, and it was desirable to stop it from going away, there would be no difficulty I suppose in doing it?—Certainly not; and I apprehend that manufacturers would soon find that out.

11,460. In your view, how came the trade of this district to grow up; was it partly because coal was to be found in the district, and partly the existence of water?—Certainly, I should say so; both combined offered a great inducement to establish manufactories, water has been cheap, and also coal.

11,461. When the first manufacturers came to this district, they found the river sufficiently good for their purposes?—No doubt of it. Within my own time, we used to take all the water for condensation from the Hebble until it was so bad that we were obliged to go to the canal.

11,462. After a time, as the use of the water and the discharge of the water were equally necessary for them, the streams became more or less impure?—Yes.

11,463. I suppose therefore that the manufacturers have been using up their means of manufacturing in the act of polluting these streams?—Certainly.

11,464. They have been driven to other sources for water obtained either from wells or from distant sources?—Certainly; every manufacturer of importance in this district will have one or two wells of his own.

11,465. But I mean in the first instance?—Of course; but in those days manufactories were on a very limited scale and required very little water compared with what they do now.

11,466. If river pollution goes on to a greater extent, I suppose manufacturers will be entirely dependent for water upon foreign sources of supply?—Yes; in our own town a large number of manufactories are springing up in the upper portion of the town, on the hill side, where there is no chance of getting water from the river or brooks, and all the water that is wanted is taken from the corporation pipes.

11,467. And the price of that water is put on to the price of the goods?—Certainly it adds to the expense of the articles.

11,468. All the water is not used for purposes for which a pure water is wanted?—Certainly not.

11,469. If a manufacturer could get part of the water from the river in a moderately pure state, he might carry on his manufacture on the banks?—Yes, and it would be much better; he could carry on his establishment at a much cheaper rate.

11,470. And if every other manufacturer was placed in the same position, and was obliged to purify the water before it was discharged, he would do the same?—Yes.

11,471. (*Chairman.*) If you desired to double your present manufactures upon the present site, could you do so with your present means of obtaining water?—Yes, I think we could, so long as we had the canal adjoining, as we want the water there.

11,472. (*Professor Way.*) Where does the canal get its water from?—From the brook.

11,473. (*Chairman.*) Is not the canal water more or less impure?—It is very bad indeed, and I think that is the greatest nuisance we have to deal with.

11,474. If the brook were purified one great part of the difficulty would be removed?—Yes.

11,475. You could extend your works then with greater advantage to yourself?—Yes.

11,476. You have the greatest interest in the purification of the river above you?—We have.

11,477. If the river was purified above you, you would feel yourself under a moral obligation to send the water back again as pure as you could for the benefit of millowners below you?—Certainly.

11,478. Even if it cost you something out of pocket to do it?—Yes.

11,479. It would be a balance of gain and loss as between trade and the means of carrying trade on?—Yes.

11,480. (*Professor Way.*) Increase of trade, which means increase of population, will be checked at a certain time by the impossibility of getting water to carry on that trade?—Yes, that must be the effect sooner or later.

11,481. If there is an end ultimately of the supply of water, there will come a time when population and trade will not increase, because there will be no water either for domestic or trade purposes?—Yes; it is one of the great essentials for a corporate body to look to, to have plenty of water in a manufacturing town.

11,482. (*Mr. Harrison.*) Is the water in the canal getting more impure?—Certainly; during the last summer we found it was a very great nuisance in our own district.

11,483. If it continues to be polluted, shall you be able to resort to it as a source of supply for your works?—I doubt it, unless some steps are taken to purify it.

11,484. What should you do in such a case?—We should have to go back to the brook, or take the corporation water entirely.

11,485. If they could not supply it to you, what resource should you then have?—If they could not supply us, then we should be in a fix; we should be stopped altogether.

11,486. (*Chairman.*) You would be stopped within the limit of your pumping power?—Yes.

11,487. (*Mr. Harrison.*) If the canal water was as bad at Halifax as it is at Bradford, and people would not tolerate it any longer, and an injunction was obtained to stop up the canal, your supply would be cut off?—Certainly.

11,488. The question of water supply to you would be one almost of life and death?—Yes, it is a very momentous question indeed, and if any unfortunate thing of the kind you have just mentioned occurred, we should be thrown entirely upon the corporation reservoir for a great portion of our water; we should get some portion of it from our own wells.

11,489. Is not what I have suggested the clear tendency of things?—Certainly there is that tendency. It is a very unfortunate thing for the canal company that they take the water from the brook below the point where the town sewage is discharged, and they ought to make I think some alteration in that.

11,490. If you were obliged to take all your water from the corporation at 9*d.* per 1,000 gallons, do you think you could carry on your trade?—It would be a very serious expense I apprehend, according to the corporation scale of charges, the larger the consumption the less is the price.

11,491. (*Professor Way.*) If you spent 1,000*l.* in bringing water into your mills, would it be a very serious thing to spend 100*l.* in purifying it before you sent it out?—I do not know.

11,492. Water is the means by which you carry on your trade?—Yes.

11,493. It is an injury to everybody else when it is discharged in an impure state?—Yes.

The witness withdrew.

Adjourned till half-past 10 o'clock to-morrow.

HALIFAX.

Mr. J. Richardson.

17 Nov. 1866.

Halifax, Saturday, 17th November 1866.

PRESENT:

ROBERT RAWLINSON, Esq., C.B., IN THE CHAIR.

JOHN THORNHILL HARRISON, Esq.

Mr. JOHN RICHARDSON further examined.

11,494. (*Chairman.*) Have you made any gaugings of the brooks connected with the town drainage?—No; but gaugings were taken in February 1865 by the then waterworks manager, for the purpose of ascertaining the volume of water passing down the stream. It does not appear that the result of those gaugings was worked out at the time, I have therefore taken them, and worked out the result.

11,495. Will you state briefly what results you have arrived at?—During the month of February the average flow of the Hebble brook during the working hours of each working day was 705 cubic feet per minute, or 507,000 cubic feet per day.

11,496. In what year was that?—In 1865. This flowincludes 1,000,000 gallons, passed out of the Ogden reservoir. The Ogden brook passed down 347 cubic feet per minute during 12 hours of each working day in the month of February 1865. These gaugings were taken immediately before the joining of the two streams at Lea Bridge. Then, during the same month, gaugings were taken below the principal sewer outfall upon the Hebble, after receiving the sewage of the town, and after the two streams I have named had joined, and the flow per minute during 12 working hours of each day was 1,502 cubic feet.

11,497. At what date was that?—February 1865.

11,498. (*Mr. Harrison.*) What was the volume passing during the other 12 hours?—That would vary considerably; in the first place, there would not be 1,000,000 gallons of water from the Ogden reservoir that would cease entirely; and the millowners would store as much water as possible in their dams for the next morning.

11,499. Any gaugings that could have been instituted would not have been reliable?—No—I may state that during these observations, the rainfall was about the average rainfall of the year.

11,500. What was that?—About three inches.

11,501. During how many days?—During the entire month of February.

11,502. Have you a table of gaugings from your sewer outfall?—Yes; I might just call attention to the different results obtained by comparing the flow at intervals of six hours in the same day. For instance, I will take the 10th November 1866 (there was no rain whatever on that day). During the first six hour, from 12 at night to 6 in the morning, the flow of the sewage amounfed to 154 cubic feet per minute; from 6 o'clock in the morning to 12 o'clock at noon it amounted to 274 cubic feet; from noon till 6 o'clock at night it was 221 cubic feet; and from 6 o'clock at night till 12 at night 261 cubic feet. I account for this larger quantity at night by rain having fallen at night; the observations as to the rainfall having been taken from 9 till 9, while these gaugings had been taken from 6 till 6.

11,503. I suppose you are aware that the flow of sewage in any system of sewers is in proportion to the water artificially supplied for domestic uses, and for trade purposes?—It is so.

11,504. It rises and falls according to the habits of the people, beginning in the morning, increasing a little at breakfast time, and then falling off at about 10 o'clock, then rising up a little between 12 and 1 o'clock, the largest flow being from 6 to 8 o'clock in the evening generally?—That is my experience here.

11,505. Sewage varies in flow according to the use of the water by the people?—Yes; in this case it would be also influenced by the use of water by mills, so far as they pass water into the sewer. The result is that the maximum daily flow of the water during the observations gives 659,822 cubic feet per day, and a minimum flow of 328,000, the average daily flow being 429,000 cubic feet per day.

11,506. That gives about 2,000,000 gallons per day?—Yes.

11,507. What quantity of water do you supply to the town?—About 1,300,000 or 1,400,000 gallons.

11,508. What is the size of the outfall sewer?—It is 5 feet by 3 feet 6½ inches.

11,509. Of what form is the invert?—Elliptical.

11,510. Is it egg-shaped?—No.

11,511. How much of the invert of the sewer does that volume of sewage occupy; is there a depth of three or four inches?—More than that, I think six or seven inches.

11,512. Out of how many inches?—Out of five feet.

11,513. Was the sewer full last night, during the storm?—Yes, it was. I had the gauge fixed in, and it has backed the water up.

11,514. Did the water in the river back it up as well?—I think not.

11,515. Was there any serious flooding last night?—Not particularly so.

11,516. No injurious flooding?—No.

11,517. The sewer has not burst?—It has a little, it has warped; but that was from the fact of the gauge being there.

11,518. There has not been any serious damage done?—No.

11,519. (*Chairman.*) Could you gauge last night?—No, the gauge dammed up the water until it lifted the top of the sewer.

11,520. What is the fall of the sewer?—One in 137.

11,521. The difference between 2,000,000 and 1,300,000 would be accounted for by pumping from the different manufactories?—Yes.

11,522. What is your next table?—The next table gives the sizes and lengths of the sewers.

11,523. Will you give me the lengths of the sewers; which is the smallest in sectional area?—The smallest in sectional area is nine inches in diameter.

11,524. What is the entire length of the main sewer; give the length, the diameter, and the rate of inclination if you can?—The largest sewer is 5 feet by 3 feet 6½ inches, and extends within the borough 1,143 yards; the gradient varies very much, it goes from 1 in 70 to 1 in 137.

11,525. Have you man-holes in that length of sewer?—Yes, we have some; I do not know how many.

11,526. Have you any ventilating shafts in it?—None. The next is a second-class sewer, and that is in length 2,090 yards; the diameter is 3 feet 6 inches by 2 feet 6 inches.

11,527. Are there any man-holes in that length?—Yes; I do not know the number of the man-holes.

11,528. Have they moveable covers?—Yes, they have.

11,529. Are they fixed at the street surface?—Yes.

11,530. Are there any ventilating arrangements there?—None. The next length is a third-class sewer, amounting to 2,413 yards; the size of the sewer is 2 feet 9 inches by 2 feet 3 inches, and the gradient is from 1 in 11 or 12 to 1 in 50 or 60. I do not know the number of man-holes there.

11,531. Is there any ventilation in that length?—None; we have no ventilators througout the town,

with the exception of connexions with the house fall pipes. The fourth class of sewer amounts to 3,580 yards, and the size is 2 feet 6 inches by 2 feet 9 inches.

11,532. Are the sewers made of brickwork?—No. They are generally made of stone; they are egg-shaped, nearly all of them.

11,533. Are they made in pierpoint stone?—Yes; 6-inch pierpoints. The next size is a square sewer. I think that is not part of Mr. Ranger's scheme; I think it has been introduced since. The length is 5,266 yards, and it is 2 feet square.

11,534. In what condition is the invert of that sewer, does it accumulate or does it keep clean?—It keeps clean; the gradients are so steep that all our sewers are very clean. The next is a square sewer. 250 yards in length, 3 feet by 2. Then we have 950 yards of a 4½-inch brick sewer, 2 feet in diameter; 166 yards of a 4½-inch brick sewer, 1 foot 6 inches in diameter, and 3,550 yards of pipe sewers, 15 inches in diameter.

11,535. Are they socket joints or half sockets?—Full sockets. The next size is 1 foot in diameter, and the length 6,500 yards.

11,536. Are these earthenware pipes?—Yes. I believe they are all full sockets. The next size is 9 inches in diameter, pipe sewer again, and the length is 7,980 yards. The total length of the sewerage within the town amounts to about 19 miles.

11,537. Have you experienced any difficulty in the management of your pipe sewers?—Not in this town.

11,538. Have they been flooded at all?—No.

11,539. Then as far as your experience goes, they answer the purpose for which they were intended, viz., to be street sewers?—Yes, they do.

11,540. They carry off the water passed into them, and they give you no trouble?—None whatever.

11,541. Have you had difficulties with pipe sewers in any other towns?—Yes. I had very great difficulty in the city of Gloucester.

11,542. How was that?—On account of the bad gradients.

11,543. Were they flat gradients?—Yes.

11,544. Was it also on account of bad laying?—I think so.

11,545. They were not regularly laid?—No; they were not.

11,546. Have you had choking and difficulties of that kind?—Yes.

11,547. If you had had no other experience than at Gloucester, you might have expressed an opinion against the use of earthenware pipes?—No; I think not, because at Barnsley earthenware pipes were used in a great measure, and I carried out part of that scheme myself. I found them answer there admirably.

11,548. Your experience is, that where earthenware pipes are sufficient for their work, and they are properly laid, they answer the purpose of public sewers?—I quite think so.

11,549. (*Mr. Harrison.*) How did you remedy the defect in the sewers at Gloucester?—By taking them up and relaying them.

11,550. Did you take up any considerable length?—About half a mile.

11,551. In what part of the town was that?—It was on the north-west side of the city.

11,552. (*Chairman.*) What have you further to state?—The next table is the length of the roads.

11,553. Have you tabulated the length of the roads within the borough under your charge?—I have.

11,554. Will you state as briefly as you can what that length is, and the character of the roads?—I have classified them as paved roads and macadamized roads, but I shall have to hand in that information afterwards.

11,555. You have certain papers which you wish to hand in?—Yes (*handing in the same*).

11,556. In the entire length of the sewers under your charge there is no systematic mode of ventilation?—None.

11,557. Have you discussed the question with your local board as to the necessity of ventilation?—I have.

11,558. Have they instructed you to make any plans for ventilation?—They have.

11,559. Have you carried out ventilating arrangements in any of the sewers you have previously constructed?—Yes, in the execution of the sewers at Gloucester.

11,560. Did you use charcoal for disinfecting the gases of the sewers before passing them into the atmosphere?—I did.

11,561. You will then have no difficulty in devising a proper method of ventilating the new sewers now under your charge, if the corporation instruct you to do so?—The corporation have instructed me to put down a system of ventilation.

11,562. Since the meeting yesterday, have you obtained some information as to the recent rainfalls and the state of your reservoirs?—Yes.

11,563. Did you go to your reservoirs last night?—Yes.

11,564. Which did you visit?—The Ogden reservoir.

11,565. Is that a large one?—Yes, it is a large reservoir used for storage and compensation water.

11,566. Of what area is that reservoir?—About 30 acres.

11,567. Do you know what the drainage area is?—1,140 acres.

11,568. What is the mode adopted in your byewash construction?—The byewash is a tower or cylinder, and the water falls vertically 66 feet.

11,569. What depth was it going over the lip of the byewash yesterday?—1 foot 10 inches.

11,570. What kind of effect did it cause in the wall?—The bottom of the bank was in a state of vibration.

11,571. Vibrating like an organ pipe with the rush of the water?—Yes.

11,572. Is there any difficulty in constructing a byewash on the solid, so as to pass the water down on to the solid ground in the river below?—None.

11,573. What is your opinion of that mode of construction?—I think it is much preferable.

11,574. If the masonry had given way what would have become of the bank?—The bank must have gone.

11,575. What amount of rainfall did you gauge yesterday?—About 4 inches up in that district.

11,576. Within what number of hours?—Within 48 hours.

11,577. What volume did it give you, flowing from the ground through that reservoir and out of it?—Upwards of 100,000,000 gallons during that time.

11,578. That was escaping from the reservoir?—Yes.

11,579. Was the water below the top of the bank or below the lip of the byewash when the rain commenced?—It was up to the top of the byewash.

11,580. Do you know what depth of water is going over the byewash this morning?—No.

11,581. Have you ever had so large a fall and so deep a flow over the byewash before?—Not in my experience.

11,582. You never saw the full effect of that volume on your bank before?—No, I did not.

11,583. What height is the bank?—66 feet to the water line.

11,584. If you calculate the velocity of a body of water falling through 66 feet, you will find that it reaches the bottom with almost the force of a cannon shot as compared, but if it falls step by step, it is landed at the bottom of the river, as easily as it was started at first?—No doubt it would be so.

11,585. What is the height of the bank above the lip of the overthrow?—It is about 3 feet 6.

11,586. If that is so, and the water was nearly two feet over your byewash, you had not above 1 foot

HALIFAX.

Mr. J. Richardson.

17 Nov. 1866.

6 inches of bank above your top-water line?—No, we had not.

11,587. Supposing this had occurred yesterday with a heavy gale of wind, you might have had all that water brought in one sheet over your bank?—But we have a very stout wall intervening.

11,588. What height is that wall?—Fully 4 feet 6 inches.

11,589. Then you must add the 4 feet to the 1 foot 6 inches of bank, and you would have 5 feet 6 inches intervening?—Yes; or 6 feet.

11,590. You are preparing a list of the mills, giving the names of the millowners, the form of power they use, the volume of water which is consumed, and other details, which, when completed, you will send in to the Commission?—Yes, I will.

11,591. (*Mr. Harrison.*) What is the diameter of that outer circle (*pointing to the plan*)?—8 miles.

11,592. That is the limit within which the corporation is authorized by Parliament to supply water to the different townships and villages?—Yes.

11,593. Is there any obligation on the corporation to find water for the villages within that circle?—I believe so.

11,594. It is not a permissive power merely?—No, it is part of our area of supply. By the provisions of the original Act, and the Waterworks Clauses Act, read together, we are bound to supply the water.

11,595. The system of waterclosets has not been carried out to any extent in Halifax, has it?—It has not.

11,596. Ashpits still exist I believe to a great extent?—Yes, we have some 1,500 or 1,600 ashpits, and probably 3,000 privies.

11,597. Are they situated in the parts of the town where the poorer population reside?—Yes.

11,598. What is the health of the people in this district as compared with others?—The ashpits and privies are generally very conveniently situated; that is to say, they are at some distance from the dwellings, and I do not think that the health of the poorer inhabitants suffers very much from the privies or ashpits.

The witness withdrew.

Mr. E. Ingham.

Mr. Edward Ingham (Halifax) examined.

11,599. (*Mr. Harrison*). Where are your works situated?—In Pelham Lane, within the town of Halifax.

11,600. What trade do you carry on?—I am a dyer.

11,601. What number of hands do you employ?—200.

11,602. What power do you use?—About 15-horse power.

11,603. What is that power?—Steam power.

11,604. What weight of coals do you use in a year?—5,000 tons per year.

11,605. What weight of ashes do you suppose they produce?—That I can scarcely speak to; we have a man upon the ground who takes a great part of the ashes away himself, the others we lead into the streets; we have no regular system of doing this.

11,606. You get rid of the ashes and none find their way into the stream?—No, we cannot do that.

11,607. Where do you get your water from?—From pumps and a spring that comes to the surface.

11,608. What depth are the pumps?—They are two miles above our place; perhaps they are 20 yards deep; there are wells there, and one spring in the same neighbourhood, which comes out at the surface, it comes by gravitation.

11,609. What volume of water do you use per day?—About 200,000 gallons.

11,610. What becomes of it after you have used it?—It comes down the town sewers.

11,611. What do you use it for?—For dyeing.

11,612. And some for washing?—For dyeing and washing, and for the engines.

11,613. What volume do you use for those three purposes; how much for boiler purposes?—We have five boilers, and they evaporate a great deal; we boil our vats with those boilers; we have about 15-horse power.

11,614. A 15-horse engine attached to the boiler would give 100-horse power?—Yes.

11,615. What volume of water do you use for washing wool?—I could not speak to that, we run it into a reservoir behind the works and use it; it is all used for washing and dyeing purposes.

11,616. What weight of wool do you pass through your works in a year?—I cannot speak to that; but it is a great quantity, 30,000 lbs. a week perhaps.

11,617. Do you dye wool?—Yes, and wool and cotton together, and a good deal of cotton warps, and some piece goods.

11,618. Those come to you to be dyed?—Yes.

11,619. Is the wool that you clean sent to you to be cleaned?—Yes; to be cleaned and dyed.

11,620. What is done with the refuse from your washing process?—It all goes down the drain now.

11,621. What do you use for cleansing the wool?—Soap in a great majority of cases; we use for bleaching purposes in cotton a good deal of soda ash.

11,622. What weight of soap do you use?—I have put down here 300 packs of soap per annum.

11,623. That would be worth reclaiming I suppose?—Some two years since I thought of that, and a practical man told me that he did not think it would be worth while from the way that we used the soap, that we had too great a quantity of water, compared with the quantity of soap.

11,624. Do you clean the wool with a machine?—Partially so; but it is nearly all hand labour, we just squeeze the soda out, but a great part of it is got out by an extractor, by centrifugal force.

11,625. Do you use a larger volume of water in cleaning your wool than is generally used?—I think three times the quantity, and more than that.

11,626. How is it that your wool requires so much?—Our wool does not require a strong soap lather, anything that would take a small quantity of oil out of it is all that we require.

11,627. What wool do you use?—The wool that we use has been already washed before it comes to us; it is in a half prepared state when we get it; it has had all the manufacturer's washing before we get it, and all our work is to take out a little oil that has been put on to make it work better, we get that out, and that is the only thing; a very thin soap lather is sufficient.

11,628. Do you think that the quantity of water used makes it hardly possible or worth while to take the soap out?—A practical man said that he did not think it would be any benefit.

11,629. Would not Messrs. Le Page and Company take it from you?—I do not think they would on that account, but I never asked the question.

11,630. Do you dye all the wool that you wash?—Yes, we dye or stove it—that is, make it white; it is scoured and submitted to fumes of brimstone.

11,631. Besides wool, have you some yarn and pieces to die?—Yes, we have a good deal of cotton warps and piece goods.

11,632. What weight do you dye per annum?—I should fancy we dye from 1½ tons to 2 tons of cotton warps daily, and piece goods, but I should rather include them in the 5 tons per day of wool.

11,633. Besides wool, do you dye cotton to any extent?—Yes.

11,634. Up to what weight?—From 1 to 2 tons a day.

11,635. Can you state what weight of insoluble woods and other dyes you use?—I can scarcely say, but we do not dye so much cotton as some of the

dyers who have given evidence before. I should say that there would be perhaps from 2 tons to 3 tons a week.

11,636. Of solid materials?—Yes, chipped and rasped wood.

11,637. (*Chairman.*) And other forms of solid refuse?—Yes.

11,638. (*Mr. Harrison.*) What are the soluble materials, acids?—I use 50 tons of oil of vitriol per annum, 12 tons of soda ash, 20 or 30 tons of alum, and perhaps 20 tons of other sorts—sulphates, sulphate of copper, sulphate of iron, and so forth. We also use from 10 to 15 tons of bi-chromate per year.

11,639. What is the soda used for?—For bleaching cotton.

11,640. Does that produce a disagreeable refuse?—No, I should think that the soda and the acids, when they came together, would neutralize each other, and would pass on quietly together.

11,641. What becomes of the insoluble materials, the dyewoods?—We burn them all; we have no means of getting quit of them otherwise than by letting them go, and we find it advantageous to burn them.

11,642. Is the wood that you use for dyeing chipped wood?—Generally so.

11,643. Is there any difficulty in burning the rasped wood?—Not particularly; we should do so if we had much of it.

11,644. In dyeing some goods, it is necessary to use rasped wood, is it not?—Yes.

11,645. Do you think that dyers who use rasped woods would find much difficulty in burning the refuse?—No, I should say not, because of the quantity they use. It depends chiefly on the quantity they use; a small quantity might pass away without observation, but I think that dyers could burn all their rasped wood with care.

11,646. You think there would be no difficulty in separating it from the liquid?—Yes.

11,647. And that it might be prevented from going away?—I am speaking as a cotton dyer. We scour the goods in the soap liquor, and it is then thrown down the drains.

11,648. What do you say becomes of the liquids after you have done with them?—They are all turned down the sewers.

11,649. Have you obtained permission from any person to pass that liquor into the sewers?—I suppose so. There were dyers in the place 20 years before I purchased it. I asked no questions certainly, and I have had no objection made to it.

11,650. Do you think that the town authorities could prevent your passing these liquids into the sewer?—I think not. I think there was an arrangement between my predecessor on the premises and the town, and, considering the time that the drain has been used since, I think a right has been established. It is 30 years since the drain was made.

11,651. That is not one of the sewers that has been constructed lately by the corporation?—No, but it empties itself into one. I think the party from whom I bought the premises made a drain himself down a certain road (that I am not very much acquainted with), but since that time there has been for a portion of the way a new drain made, and that empties itself into the town sewer.

11,652. Have you tried any experiment to purify the water after it has been used for dyeing?—No.

11,653. Do you know of any having been tried?—I think not. If there was any, I think the remedy would be worse than the disease. It would require so much ground and take so much time that it would be something like the Bradford canal, the greatest nuisance in the town.

11,654. Are you aware that Mr. Ripley does separate, not only the solids, but in a great measure the colouring matters?—Yes, I am aware of all his doings. He does out of doors just what I do indoors. I never put in anything that requires separation. He separates the solids; we cannot put any solids down the drains for fear of stopping the drains, and we might do as Mr. Ripley does under other circumstances.

11,655. Supposing you did pass the solid matter into the drains, and the drains were stopped up, who could remedy that mischief?—That I cannot speak to. It is a momentous piece of business when it comes, but I believe the town would have to do it if I could wait for them. We have done it ourselves; we cannot wait a minute. Sometimes they send a man or two to help us, but it has never occurred but twice, when something had got into the drain in bulk, and had stopped the drain up.

11,656. The charge of the drain appears to be a joint stock between you and the town?—Yes, I suppose it is.

11,657. From the manner in which you get your water, I presume that it is not polluted by any other dyer?—It is not, before we get it.

11,658. Do you go to much expense in pumping?—I take some water from the town as well.

11,659. How much do you take?—Not much last year, our men have not had much to spare, but sometimes we use perhaps 5,000 or 6,000 gallons a week.

11,660. Would you use more if you could obtain it?—Yes, if we could depend upon it; to get a large business and to be stopped is rather a serious affair.

11,661. Is the water that you get from the town suitable for dyeing?—Yes, it is.

11,662. More so than your own water?—No, it is not so good as mine.

11,663. What do they charge you for 1,000 gallons?—I do not know the scale for what we use now; but the lowest price is about 6*d.* per 1,000 gallons.

11,664. The scale is variable?—Yes, it varies from 1*s.* to 6*d.*

11,665. (*Chairman.*) What is the lowest scale of charge at Bradford?—According to the last list I saw I think it is about 2*d.* and a fraction for 30,000 gallons a day.

11,666. If you could have water supplied in bulk at 2*d.* per 1,000 gallons, would you use more?—Yes, if we could be insured of it.

11,667. (*Mr. Harrison.*) Do you go to much expense in pumping water?—No, but I have been at great expense in sinking and boring for it.

11,668. What expense have you incurred?—From 1,000*l.* to 1,500*l.*

11,669. To what depth did you sink?—About 20 yards.

11,670. Did you bore besides?—No.

11,671. Did you find much variation in the level of the water in your well at different seasons of the year?—Yes; just now I should think, in those springs, there would be something like 500,000 gallons a day.

11,672. What had you in the dry seasons, say the driest part of 1864 and 1865?—Perhaps 50,000 gallons.

11,673. At what time of the year do you find that you get the minimum quantity?—I should say it would be far into July or in August. If the weather is tolerably dry the springs will be as low then as at any time.

11,674. When do the springs fill and give you the largest volume of water?—This year they filled up very soon, because the rains came on early. It depends upon the rains. I am not well acquainted with the quantity that I have in the summer; we only finished it last autumn.

11,675. What arrangement have you in your works as to privies?—We have privies, and we mix the sewage with soil and use it for manure.

11,676. Upon your own land?—Yes.

11,677. Do you find benefit result from it?—Yes.

11,678. Do you remove it daily?—No, we have a heap of soil and we throw it over occasionally upon the refuse to keep it sweet; when there is any quantity collected we set some men to take it away.

11,679. Can you do that without causing any nuisance?—Yes, we never had a complaint from any one near us.

11,680. Nor is it any nuisance to yourself?—No;

HALIFAX.

Mr. E. Ingham.

17 Nov. 1866.

I live very near to the heap, and I never noticed it to be a nuisance.

11,681. Have you any waterclosets besides?—No, we live so near that we do not require them on the premises.

11,682. Have you lived long in Halifax?—Yes; this time I have been here about nine years. I left Halifax for 10 years on account of business.

11,683. What was the condition of the Hebble at the earliest time you can remember it?—In about 1831 it was quite different from what it is now, it is now a good deal worse.

11,684. Was the water in the Hebble suitable for dyeing purposes then?—Yes, I should say it was. I know of one dyer who used to wash in the beck, and I think that if he could do that he would be able to dye with it.

11,685. If you had been a dyer from that time to this should you consider that the pollution of the stream from that time had been injurious to your works?—Decidedly.

11,686. Therefore you think that the pollution having been allowed to go on has become an injury to certain dyers and others?—Yes, no doubt of it.

11,687. If the stream was restored to its former state would that be a boon to them?—No, by no means.

11,688. Why not?—Because if only one dyer was allowed to exist on the stream he would make the water in such a state that the others could not be very profitably employed.

11,689. But I mean supposing each dyer was obliged to purify the water before he passed it back into the beck?—He could not purify it so as that the other dyers could use it; if he turned it away it would deprive the other dyers in a dry time of water for condensing purposes.

11,690. Colonel Akroyd stated that by the use of lime, the solid matter being first separated and the liquid filtered, he had found it was quite possible, and within a small compass, to pass the water away from the works very nearly clear?—It is possible, I daresay, to treat a tumbler of water in that way, but to do that with what is used by all the dyers in Halifax would be a matter of great difficulty, the quantity upsets the idea altogether, here at all events.

11,691. That is to say there is no room for carrying out any mode that you have seen practised?—Yes; again lime would be more injurious to the dyers below than the colouring matter in the water. I do not believe that water is any better for being made to look better by chemical means of that description.

11,692. Do you use chemicals in your dyeing process, which apart from the colouring matter in the water would make the water, after it passes from your premises, unfit for other dyers to use?—Yes, decidedly, for general use; there are some colours that would make the water unfit for general use after we had parted with it.

11,693. Do you dye bright colours?—Yes.

11,694. How do you dry your pieces?—On cylinders heated with steam.

11,695. Used you formerly at any time to dry them in the open air?—That was a common practice here once, but it would not be done now; some dark colours might be so treated, but the atmosphere is hardly sufficiently good for fine colours and whites.

11,696. You find the smoke of the district disadvantageous in that respect?—I fancy so, but we should not use tenters now if we could. The cylinder system is quicker, and better in all ways. If there is to be any good done to the river above or below there is nothing like this, to get plenty of reservoir water to wash with. Filtering is under all circumstances a remedy that would be worse than the disease, there would be a regular pestilence.

11,697. Do you desire a reservoir in order to flush out the river?—Yes, to save the winter water for summer use.

11,698. You would diminish the winter floods?—Just so, but the winter floods would still be sufficient to do a deal of mischief if we may judge from yesterday.

11,699. Is not that rather an exceptional case?—Yes.

11,700. Your remedy is to increase the reservoir room and increase the steady supply of water; and further, you would prefer that the pollution should be allowed to pass into the river?—Certainly; but it is not for me to say anything, because I could scarcely divest myself of selfish considerations; but situated as I am, I certainly should say so.

11,701. If it could be shown that you could purify the water, as Colonel Akroyd has suggested, in a small compass, without any great trouble or expense, do you think it would be fair to call upon the manufacturers to carry that out?—That is another point. I believe that the 900 waterclosets in Halifax require us dyers to prevent a regular nuisance and pestilence. I believe that the acids we send down are a great deodoriser of the stream, and that but for them, the stream should be in a worse condition than it is; and to divest this water of these deodorisers, and to continue to allow the sewage to run into it as it does from the town, I think would create a considerably greater mortality than there is. Therefore I believe that we dyers are great benefactors to the country.

11,702. But if the sewage is not sent into the stream your assistance will not be wanted?—I do not think there is any system by which that water can be purified.

11,703. Supposing that the corporation determine to carry the sewage of the town on to the land and to utilize it there, but find that your dye waters are an injury, and make the sewage of less value for agricultural purposes, they may turn upon you and say, "We cannot allow you to pass your waste liquor into "the sewers: you must take some steps to purify it." What would you say to that?—There would be no way but to call the acids alkalis; they would not interfere with the sewage. I believe that even sewage applied on land would make the country very unhealthy unless deodorisers are employed with it. I think that we dyers will be required to some extent, even in a sanitary point of view; the town authorities must use something to fix the bad gases, and I think we do that now, and the moderate quantity of stuff that we turn out would be useful as manure.

11,704. The further that is carried, of the less value in all probability you would make the sewage as manure?—Yes, there would be a little too much certainly.

11,705. Sewage is undoubtedly a valuable article if properly applied?—Yes.

11,706. It does not appear to be the best way of overcoming any practical difficulties that there may be, to diminish the value of the sewage?—No; as far as I am concerned I should have to shut up my works, I could not do anything. I have not room, and there are many dyers situated like me.

11,707. It might be otherwise, if you were shown a way of doing it within a small compass?—You cannot do it. Lime will cure the evil to some extent. I am aware of that; we use lime, but at the same time the water is worse when the lime is put in; it is cleared to some extent, but it is no better than it was before for general purposes.

11,708. How is that?—Because the lime is very detrimental to us as dyers.

11,709. But not to the manuring properties of the water?—Not much so.

11,710. (*Chairman.*) Did you hear some questions put as to the prevention of throwing ashes into the river; I suppose you would say that some plan might be carried out?—Yes; I believe there ought to be a law in this town to prevent it. It can be prevented.

11,711. Would it be beneficial if the river margin were protected and the bed of it improved, so that the sediment should be gradually passed away, and not allowed to accumulate?—Yes.

11,712. You do not see your way to extracting the

colours from dye water, and you think that a mixture of chemical ingredients combined with the colours cannot possibly be injurious to health?—Yes.

11,713. As far as you understand chemical processes, you think that if means are devised to extract the colouring matter by some chemical process, the water might be made brighter in appearance; but that it would be in reality more unfit for any purpose that you wanted it for?—It would be less suitable for any manufacturing use.

11,714. It is quite possible for a bright water to be foul and unfit for dyeing purposes?—Yes.

11,715. You might have a bright looking water that would be more injurious than a dirtier water that had not any chemical ingredients in it?—Just so. Water that is slightly coloured will do for dyeworks, but water is more plentiful now on account of the town supplying water. We used it to take the beck water at Bradford to dye colours with; we were compelled to do so or else we should have had to shut up our works for want of water.

11,716. You, as a dyer, would be willing to do all that was practicable to prevent the river being obstructed by solids?—Decidedly, I think all that ought to be done.

11,717. You do not see your way to any practical interference to compel you to abstract the colouring matter?—No.

11,718. You think that it must go down the stream as it does now?—Yes.

11,719. And although the water may be discoloured you believe that it will not be injurious to health?—Yes.

The witness withdrew.

Mr. Joseph Travis Clay (Rastrick) examined.

Mr. J. T. Clay.

11,720. (*Chairman.*) Are you a resident in the borough of Halifax?—No. I live at the extreme eastern boundary of the parish.

11,721. What trade do you carry on?—I manufacture the finest fancy cloth.

11,722. Is it made from wool or from a combination of wool and cotton?—It is principally worsted; very fine worsted and some foreign wool.

11,723. Your works are situated at Rastrick, I believe?—Yes.

11,724. How far distant from the town-hall?—About four miles.

11,725. Upon what stream are they?—It is a very small stream which runs into the Calder opposite to Brighouse.

11,726. What number of hands do you employ?—About 80 on the premises.

11,727. Do you use any kind of water or steam power?—We use steam power, large boiler power, but small engine power—about 50-horse boiler power and about 12-horse engine power.

11,728. What weight of coal do you burn per annum?—About 600 tons.

11,729. What do you do with the ashes?—We throw them out, and there is generally plenty of demand for them, for mending roads and making footpaths.

11,730. Do any of them find their way into the stream?—Not any; indeed the stream is too small to carry any.

11,731. Have you any form of refuse from the manufacture besides the ashes?—There will be a good deal of dirt in solution.

11,732. With the water?—Yes.

11,733. What volume of water do you use in a day? It is very difficult to state the quantity; the bore-hole supplies about 7,000 gallons a day, and then we have a small stream of water coming down, and that stream varies very much in quantity; we use all the water whether little or much.

11,734. Do you get water from any other source besides the stream?—The stream and the bore-hole.

11,735. What depth is that bore-hole sunk?—About 40 yards.

11,736. What do you pump from it?—It raises to the surface about 7,000 gallons a day.

11,737. Of what diameter is the bore-hole?—About three inches.

11,738. What is the quality of the water?—It is a little harder than the surface water.

11,739. You can use it for your work, but it is a little hard?—Yes, it is a little hard; the surface water is very good.

11,740. Does the bore-hole water vary in volume at all at any particular times of the year?—Last summer it was rather less, but taking it generally it is very uniform.

11,741. It flows uniformly over the surface into the reservoir?—Yes.

11,742. Do you dye on your premises?—Yes, a good deal.

11,743. What weight of materials do you dye per annum?—We do not dye a great weight; it is very fine material, and the weight is not very large; I cannot give you the particulars.

11,744. Do you use soap?—Yes, a considerable quantity.

11,745. And oil?—We use about 5 cwt. of soap a week, and there is a little oil with the yarn. The principal part of the material that we use we buy in the spun state in the yarn.

11,746. What becomes of the soapsuds?—They run down the watercourse.

11,747. You do not so deal with soapsuds as to attempt to extract the soap?—Not at all.

11,748. Would it not pay?—It is impossible to extract the soap from an immense quantity of water in comparison to the soap that is used.

11,749. Because the soap is so much diluted?—Yes.

11,750. Have you ever tried what effect the soap waste would have on grass land?—We have no grass land below us over which we have any power. From the peculiar stratification of Rastrick it is perfectly impossible to attempt anything of that sort without injury to other parties.

11,751. Is the place so thickly peopled below you? No, but the water supply to the village is from wells, and the surface of Rastrick is on the flagstone series; it rests on a bed of shale, which is perfectly impermeable to water, and if dirty water is thrown upon the surface it sinks into the wells and pollutes them.

11,752. Do you obtain water from your bore-hole from the flagstone?—No, below it. The water sinks through the flagstone and runs out at the point of the junction of the flagstone and the shale.

11,753. Therefore all the wells derive their water from the same level almost?—The same geological level.

11,754. The same outcropping?—Yes.

11,755. Has there never been any attempt made to utilize the soap refuse from your manufactory or any other in Rastrick?—Not at all. I may say that the manufacturing operations in Rastrick are only small; there are only four mills on the stream, two above me and one below me.

11,756. How far down have you ever noticed the effect of the water refuse of the district?—Until it joins the Calder.

11,757. Is the water discoloured all the way down?—Yes.

11,758. It does not lose its colour?—The distance is too small. The whole length of the watercourse from the highest mill to the Calder is about a mile and a half, and the stream is very rapid.

11,759. It flows and disappears in the Calder?—Yes; there are 400 feet of fall in one and a half miles; the water rapidly runs away.

11,760. Have you any refuse dyewoods in a chipped or rasped form?—A small quantity; we burn the dyewood.

11,761. Chipped and rasped as well?—Yes.

HALIFAX.

Mr. J. T. Clay.

17 Nov. 1866.

11,762. Have you any smoke prevention apparatus in any of your boilers?—No.

11,763. Do you pass thick smoke into the atmosphere?—Yes, occasionally.

11,764. Did it ever occur to you to try to prevent the loss of fuel by preventing smoke?—Yes, we have tried various schemes at different times.

11,765. Have they not answered?—No. I have just put another boiler down to have abundance of boiler room, and I believe that that is the best means we can adopt.

11,766. If it can be shown that by careful firing the smoke can be prevented, should you consider it a great hardship if you were compelled to make your men fire more carefully?—No, I do all I can now to effect that.

11,767. And perhaps you would not like to be interfered with?—I would rather not.

11,768. Would you rather continue to make smoke?—I would make as little as I could help in any case.

11,769. If a regulation were made that no manufacturers should make smoke, or that they should use the best means they could to prevent it, do you think that would be a great hardship?—If it could be done I would do the best I could to accomplish the purpose.

1,770. Have you privies or waterclosets on your premises for the workpeople?—There are four privies and one watercloset which is very little used.

11,771. Do you do anything with the refuse?—It is mixed with ashes and carried on to the land by farmers.

11,772. You do not pass it into a sewer?—No.

11,773. I suppose there is nothing to prevent any manufacturers establishing themselves on the stream?—There is not sufficient water for any more manufacturers on that stream; it is as fully occupied as it can be.

11,774. You think that it is used up?—Yes.

11,775. Then you are living with the idea that you will not be interfered with by any person above you?—I may say that previously to 1857 we had no mills above us. At that time two mills were established. There was a dyehouse formerly, and we found great difficulty from its fouling the water. We had two lawsuits which went to the assizes about that matter. In 1857 two mills were erected which discharged a great quantity of refuse into the stream. I complained about it. I threatened proceedings, and the owners and occupiers now bring us clear water from some springs, and we allow the refuse to come down the watercourse without complaining, so that the whole of the clear water which can possibly be obtained is taken.

11,776. Then you have arranged amongst yourselves as to pure water, and you have also arranged that the polluted water shall pass down into the main stream?—Yes; we use the polluted water for condensing purposes for the boilers, and the pure water from some of these springs supplies us with water for dyeing and scouring.

11,777. Were these lawsuits gone on with?—Yes, two were gone on with.

11,778. What did they cost you?—The law suits were before my time.

11,179. But I suppose that lawsuits are occasionally rather costly?—There is a gentleman in this room who can tell much better what they cost than I can. The last lawsuit which we had, I think, was in 1823.

11,780. Do you think that, as the law stands now, there is a liability of individual millowners getting into quarrels and disputes and into lawsuits with regard to these water rights?—Certainly, a very great probability.

11,781. And do you think that it would be an advantage if there were some superior tribunal to settle what should be and what should not be without all this great cost?—I do not see any tribunal except the courts of law of the kingdom; I do not see how any special tribunal could be instituted.

11,782. Do you not think that a conservancy could be established which should have jurisdiction and authority over the river basin, so as to lay down general rules and bring all manufacturers into one order of proceeding?—If I had been supplied with water for an indefinite length of time, I should not be disposed to submit my rights to the arbitration of any conservancy, and I should much prefer the courts of justice.

11,783. The common law of the land?—The common law of the land.

11,784. Supposing that your stream was a little larger than it is, and that it would enable half a dozen more dyeworks or mills to be established above you, and that those individuals chose to use that stream for every purpose which they thought an advantage to themselves, throwing their ashes, besides solid refuse of every other kind, and divers forms of pollution, into the river, would you rather be in a condition to indict them, and to fight the matter out, than simply to appeal to a board which could stop them in an instant?—I should be very glad if there was a board which could stop them in an instant.

11,785. And a board which could not only stop them, but compel them to do something which would be not only for the benefit of themselves, but greatly for your benefit?—But any powers which that board could exercise must devolve upon them by some law of the land.

11,786. Of course Parliament must devise a new law. At present all you gentlemen in Yorkshire do just as you like?—I cannot quite agree in that.

11,787. Is it not so?—You, I daresay, know other districts besides your own. Is it the fact that the rivers are polluted?—Very greatly.

11,788. Is it the fact that that pollution has grown up within the last 20 years?—Very greatly indeed.

11,789. Is it the fact that as trade increases, and more work is done, that pollution will increase?—Yes.

11,790. Is that a desirable state of things?—By no means.

11,791. Can the common law stop it?—I cannot answer that question.

11,792. Do you think that it can?—I think that it scarcely can, because it would be so difficult to fix the blame upon any particular individual.

11,793. You have a thousand people committing a nuisance, and you have one person single-handed to sue them?—Yes.

11,794. Is there any chance of success there? Supposing that you are situated below Halifax, you have to face the borough of Halifax and all the inhabitants of it, whatever nuisance they commit upon you?—I decidedly think it necessary that there should be a means of protection.

11,795. Do not you think that a conservancy board would be no more afraid of the borough of Halifax than it would be of the simplest manufacturer in the district? It would have authority to interfere with the largest proprietors or any number of the largest proprietors, and the machinery would be as simple to deal with them as it would be to deal with an individual?—It would depend upon the constitution of the Board.

11,796. Do you not think that if a conservancy board were formed it should be formed of representatives of suitable interests?—That is the great difficulty.

11,797. But things which are difficult are not impossible?—Certainly not.

11,798. Do you not think that you would be using your time very profitably if you for a short time thought of that point, and if, when the question had to be discussed, you tried to make the board an efficient one?—I have thought a great deal about the subject of pollution of rivers.

11,799. But yet you have come to the conclusion that you would rather be left alone?—I would rather be left alone personally, that is all.

11,800. Could not you divest yourself of a little of that selfishness (I do not use the word offensively—we are all of us selfish), and look at the question a little more broadly?—I have made my answer upon that assumption.

11,801. A man should work for himself, but he should also work in a broader and more catholic spirit, and should see that there are other persons besides himself. True self interest is that which considers the welfare of the state; selfishness is so developed into philanthropy?—With respect to the pollution of the river, I think that it is quite impossible to look to the river being made perfectly pure.

11,802. We will not consider absolute purity, but what is a practical improvement. If 20 tons of solids are thrown in what do you say?—They should not be thrown in.

11,803. But persons say that they have done so for 50 years, and that they have a right to do it?—I cannot conceive how a person can have a right to throw solids into the river. My opinion is that all solid matter should be kept out of the river. It is perfectly impossible to keep out foul water holding certain matters in suspension.

11,804. You mean the dye matters?—Yes, the liquor.

11,805. Supposing that all matters in suspension are kept out, the water in itself would never become offensive, would it?—No.

11,806. It is the solid part which is offensive?—Yes, the offensive portion arises chiefly from the animal matter contained in the wool.

11,807. That animal matter, the oil and the grease, can be taken out, and is taken out to a great extent?—A certain portion is taken out.

11,808. Do you know that the manufacturers of Yorkshire at this moment are receiving not less than 100,000*l.* a year for waste products from washing water?—Yes, some manufacturers may be receiving a large sum of money, and other manufacturers may not be able to receive a farthing.

11,809. We have an estimate from very competent persons that 100,000*l.* a year, namely, 2,000*l.* a week, is now paid back for the refuse which formerly passed into the river?—In the case of certain manufacturers the soap is capable of being extracted, as they let out their soapsuds in such a state that it can be done, but other manufacturers, of whom I am one, send out their soapsuds in such a diluted state that it is impossible to restore the soap.

11,810. It would be impossible to restore the soap so as to pay you a profit?—I believe that it would be physically impossible.

11,811. That is a question of chemistry. We have competent authority for stating that 100,000*l.* a year is paid for the waste soap recovered, but the same authority of his own knowledge says that soap to at least the extent of another 100,000*l.* a year is carelessly passed into the river, which could as easily be recovered as that soap which is now recovered?—Suppose that I have 1 lb. of soap in 1,000 gallons of water, or even 100 gallons of water, I say that it is impossible to restore it.

11,812. It is not impossible; if you mean impossible abstractedly I say no?—All things are possible.

11,813. That is possible at all events, mechanically, because, without being a chemist, I may tell you that I could by boiling evaporate away all that water, and leave a residuum at the bottom, but I do not state that it would be possible practically?—I am merely speaking of it practically.

11,814. If chemistry can discharge (which it does) soap from a certain volume of water, it is not fair to say that because the soap is more largely diluted, it is impossible to take it out; it may not be practical as a paying concern, and it may not be advisable?—We wash our pieces beginning with their being dirty, till the water comes out quite clear, and therefore it is in every state of dilution.

11,815. Suppose that you had a tank of the size of this room, and that you were obliged to pass all the refuse water in so that the sediment should go out at the bottom, and that the water should flow out at the top?—That would be a very good plan where people have room; if the effluvium were not a nuisance, which it probably would be.

11,816. What is to prevent your being made to have room?—Because I could not find it. I could not extend my works an inch in the direction which would be required for that purpose.

11,817. Of course I do not know what the works are?—I am now speaking of old works. I entirely agree with you that in all new works something like what you have described would be most advantageous, but my works have been in operation for from 60 to 70 years, and other works of the same kind in Halifax are in a circumscribed position. A dyer or manufacturer may not have another inch of ground which is not appropriated, which is my case, and therefore he could not make those tanks.

11,818. And do you say that he has no money to buy any land outside?—We come immediately upon a turnpike road.

11,819. There is land upon the opposite side of the road?—Yes.

11,820. And I suppose that a pipe of 4 inches diameter would carry the refuse water from your works anywhere?—Yes; I should be very glad if everybody was made to do it.

11,821. (*Mr. Harrison.*) Would you object to do it if all others were made to do it?—No, because it would be a very great benefit to me if my neighbours above me would do it; it would be of far more benefit to me than the cost of my having to do it myself.

11,822. (*Chairman.*) If there was a general conservancy board, and you said to them, "I cannot "carry out these regulations of yours, because there "is no room on my premises." Either you might individually go where there was room, or the conservancy board might say to you, "We see that you have "not room here, but we, under our powers, will take "your soapsuds and your refuse water to a place "where there is room, and combine them with those "of other manufacturers, and they shall be dealt "with; and it will cost you so much per annum; "we will ask you to pay for what you cannot do "yourself, and we will do it for you?"—It would be a very capital thing.

11,823. When we are speaking in that way, I am only supposing that it would be something which you could afford to pay. If the refuse is now costing you nothing as you are wasting it, you might not like to pay 50*l.* a year for it, but if every other person in the same trade and similarly situated were put under the same restrictions, it would then be a matter of arrangement between you and the general public, and you would have to charge so much more for your dyeing?—So far as I am personally concerned, I should be very glad if it could be done; it would be a benefit to me, inasmuch as I should receive all the water from the beck in a state fit for use.

11,824. Is there anything which you would wish to add to your evidence?—I was summoned here to give evidence as to the Rastrick stream, and now that I am here, I should like to say a few words upon the state of the Calder, which is the principal stream. The Calder skirts Rastrick for about two miles, and within the last 20 years it has amazingly increased in foulness. About 20 years ago it was a very pure stream, plenty of trout were caught in it, and it was a very great amusement to the weavers to go and fish there; but now there is nothing of the kind to be seen. I have made a few memoranda respecting the Calder, and I have arrived at much the same conclusions as those which you have indicated, that is to say, with regard to the corporation of Halifax, which I consider to be the great sinner in the neighbourhood, I think that they ought to provide means to catch the solid part of their refuse before they send it into the Calder. My idea with regard to this question generally is, that we must abandon the Calder as a source of pure water, and that everybody should be compelled to retain all solid matters, so as to render the Calder innoxious to the health and comfort of the people; and that we must look to the higher ground in the parish for a supply of pure water for

HALIFAX.

Mr. J. T. Clay.

17 Nov. 1866.

manufactures. The Halifax corporation, as you have had evidence, are making very large reservoirs, and I consider that to be the direction to which we must look for a supply of pure water. The enormous rainfall which there is in this neighbourhood would provide plenty of water for every purpose, without interfering with the volume of water required to cleanse the river.

The witness withdrew.

The witness subsequently forwarded to the Commissioners the following letter:

Rastrick, near Halifax,

GENTLEMEN, Nov. 22d, 1866.

IN reference to the evidence which I had the honour to give before the Commission on Saturday last, I beg leave to hand to you the result of experiments made to ascertain the proportion of solid matter in the refuse poured into the stream from worsted dyehouses.

1st. I took 6 oz. = 2,625 grains of soapsuds of the ordinary strength and evaporated to dryness. The result was 6 grains of solid matter or $\frac{1}{437\frac{1}{2}}$.

After scouring with soap the goods are washed in pure water, and I calculate the proportion of soap to the whole of the water passing through the machines as 1 in 800.

It must be noted that the animal matter had been removed from the wool in the first operation by the spinner, and no doubt the product was sold.

2nd. I took the same quantity, say 2,625 grains of the decoction of logwood chips after the dyeing process was completed, evaporated to dryness, and found a residuum of 7 grains or $\frac{1}{375}$. This refuse as discharged into the stream is of a dark claret colour, and tinges a very large volume of water, so that a casual observer could scarcely credit how small a portion of solid matter is contained therein.

I have the honor to be, &c.

(Signed) J. TRAVIS CLAY, F.G.S.

To the Rivers Commission. &c. &c. &c.

Mr. J. W. Child.

Mr. JOHN WRIGHT CHILD (Halifax) examined.

11,825. (*Chairman.*) Are you a resident in the borough of Halifax?—Not in the borough, but in a district immediately adjoining.

11,826. Do you carry on any form of manufacture?—Yes, Mr. Akroyd's, not my own.

11,827. Where are the works situated?—At Copley, on the bank of the Calder.

11,828. What is the business?—Worsted spinning principally.

11,829. Are they the same works as Mr. Akroyd spoke to yesterday?—A portion of the same; he was principally speaking about Bowling Dyke, which is within the borough; these works are not in the borough but about half a mile outside of it.

11,830. What number of hands do you employ?—About 850.

11,831. What horse power do you use at those special works?—About 120 nominal steam, and an average of 30-horse water power.

11,832. What weight of coal do you consume per annum?—About 3,000 tons in a year for the engines.

11,833. What do you do with the ashes which you make?—We bury them.

11,834. You do not pass them into the stream?—No.

11,835. Have you waterclosets or privy accommodation?—Privies entirely.

11,836. What do you do with the refuse?—We take it away.

11,837. You do not pass it into the stream?—No.

11,838. Do you dye and wash?—We do not dye, we scour.

11,839. What weight of soap do you use per annum?—Only a small quantity; we only wash about 25 packs a week there; of soap and alkali together we use about 800 lbs. a week.

11,840. Do you use any acids?—No.

11,841. Any oil?—Only a very small quantity.

11,842. What volume of water do you use per week?—For condensing purposes about 470,000 gallons a day; nearly the whole of that is returned into the river in the same state, with the addition of a little heat; about 3,000 gallons of it would be used for scouring purposes.

11,843. You have obtained water from the river entirely?—Yes, with the exception of a small spring for domestic purposes.

11,844. Then you do not obtain any from the waterworks?—No.

11,845. What becomes of the waste refuse from the soap washing?—It is sent into the river.

11,846. Do you utilize any of it?—No.

11,847. Is it too poor for you to utilize it?—The quantity is too small to pay for the capital which would be necessary to convert it.

11,848. If there were general regulations as to the stream, would you object to being made to purify that small volume?—Business people do not often wish to do anything at a loss. I may say that there are works for the conversion of soap, within a few hundred yards of the place, but they will not take away our refuse suds even at a gift.

11,849. Supposing that the extraction of soap from your water involved a loss, but not any very serious loss, do you think that it could be done?—Yes.

11,850. Or suppose that you had sediment tanks and extracted the soap by letting it fall down and letting the effluent water pass away?—I should not like a nuisance of that kind about the place, exposed to the sun and the air.

11,851. Is it a fact that soap waste when it becomes stagnant is very offensive?—Yes.

11,852. Then any deposit from that soap waste in a river as large as the Calder, if subsequently exposed on the banks, would be liable to become corrupt and a nuisance?—Yes, if it was exposed on the banks; but if the dilution was sufficient I do not think that it would be so.

11,853. Do you know in what condition the Calder is in a very hot summer and in dry weather?—It is much worse than it used to be.

11,854. Are noxious gases given off upon the banks?—I think not; the banks are too steep; it may be so lower down the valley.

11,855. I suppose that the general pollution of the Calder is made up of littles?—Yes.

11,856. And every item which is added is an addition to the pollution?—Yes.

11,857. And the prevention, as far as practicable, would have to be applied to both small and great?—Yes.

11,858. Do you use any means at your works to prevent smoke?—Not at present; we did sometime ago, but we did not find it very effectual.

11,859. Did you use any patent?—Yes, Jukes's.

11,860. Why did you discontinue Jukes's patent apparatus?—On acconnt of the trouble which there was with it.

11,861. Did it give you the power which was required?—No, we had to press it.

11,862. To force it?—Yes.

11,863. At present does your chimney send forth smoke considerably?—No, not in proportion to the quantity of coal used. We have plenty of boiler room, and we give the men directions to be as careful in firing as they possibly can be. I think that if the men fired more frequently, and with less coal at a time, and allowed a fair admixture of air, according to the quantity which they put on, it might be better still.

11,864. Then, I suppose, that any general regulation which put all manufacturers under the same restrictions would not be obnoxious to yourself?—No.

The difficulty is in making the workmen attend to orders.

11,865. The authority would have to interfere with you, and not with the workmen?—Yes; I do not see any other way.

11,866. You would not like any external authority to step between you and your workmen?—I think that it would not be advisable.

11,867. But any general interference must be with the manufacturer, and he must find means to interfere with his workmen?—Yes.

11,868. How long have you known the Calder?—25 years.

11,869. In what condition was it when you first knew it as compared with its present condition?—It was more clean than it is now; of course every dwelling house and every manufactory established on its banks makes it worse.

11,870. Then, as the country increases in manufacturing and commercial wealth, if things are left as they are the river is likely to get more foul?—I do not think that that is a necessary consequence. If, at every manufactory which was set up, and at every dwelling house which was set up, there was a sufficient supply of water independent of the stream, that is to say, from waterworks, I do not see that the pollution would increase.

11,871. Do you think that if the district is left alone there will be an improvement, or that it will be as heretofore, that with an addition of population there will be an additional pollution?—I think that it is very likely that pollution will increase. I do not see any mode of remedying it except by an additional supply of water.

11,872. Do you think that the establishment of these reservoirs, and the bringing in of an additional supply of water, sufficiently dilutes the polluted water—I think that it is the most practical mode of dealing with the matter.

11,873. It does not get rid of the pollution?—No; I do not see how the fine matters held in suspension, such as the colouring matters, or matter held in chemical solution, can be got rid of. I think that a general law prohibiting heavy matters, such as ashes and dyewood, being thrown into the stream, would be generally acceded to, and carried out.

11,874. But you think that if the dyers and printers and manufacturers generally were told that they must restore the streams and rivers to a state of purity, it would be impracticable, and would be resisted?—I think so. It would be impracticable. It is possible to filter the water, and to send it into the river perhaps in a clear state, but still all the matters chemically in solution must pass so far as I know.

11,875. Have you ever tried any experiment with a smaller quantity of water, allowing it to settle and seeing what became of it?—I have not. We do not dye at all.

11,876. Are you aware that the great mass of the colouring matter is not chemically combined with the water, but is mechanically suspended in it?—It is mechanically suspended to some extent, I think, but not entirely.

11,877. Is not that proved on a grand scale in your rivers, because as they flow downwards by exposure to the sun and the air, and the earth forming the bed of the river, the water loses its colouring matter as it goes to the sea?—Yes.

11,878. Showing that it is not a chemical but a mechanical combination?—It may show that, but I think that some reformation of matter takes place, and that the improvement may not be entirely owing to the process of filtration.

11,879. The action of the atmosphere has a great influence in bleaching matters in water?—Undoubtedly.

11,880. You say that you have never made any experiment with dye waters; you do not dye?—We do not, and I have not tried the experiment. I merely say that some of the colouring matter must be in chemical solution, or otherwise it would not permeate the whole fibre of the wool for instance.

11,881. There are chemical ingredients put in which no doubt enter into chemical combination, and which are inseparable, except by evaporation?—Yes.

11,882. (*Mr. Harrison.*) Did you hear Colonel Akroyd say yesterday that he had tried an experiment with lime?—I did not hear his evidence yesterday. I have heard him speak about it.

11,883. He stated it as his opinion from certain knowledge, that the application of lime would separate the solid dye matters which were in suspension, and leave the water very nearly bright, and that by means of a simple filtering apparatus all that solid matter might in his opinion be separated, and the water allowed to pass off very nearly clear?—Perhaps it might be done, the lime would take up the acid.

11,884. Do you think that it would be a right thing to provide that that should be done?—Yes, as far as it was practicable, but I think that on a large scale it could not be carried out.

11,885. (*Chairman.*) Have you anything to add to your evidence, or any remark to offer?—No, except on the matter of conservancy. As I have said before, I think that throwing heavy matters into the river would not be done by every one, but would be done by some people, whereas a law to prevent it would be obligatory.

11,886. A conservancy would have jurisdiction over the entire river area, to put everybody in the same situation?—Yes, as far as regards solids.

11,887. And to carry out improvements in the river and its tributaries?—Yes.

11,888. Do you think that some of the tributaries might be materially improved by having their channels straightened, and their beds deepened and cleansed?—Perhaps they might. Such a flood as we had yesterday, or any flood in the winter does that.

11,889. But it does it with a considerable amount of mischief occasionally?—Yes.

11,889*a*. Floods are rather wayward?—Yes.

11,890. They do not respect either persons or property?—If all the water which has fallen upon the hills during the last few days could have been stored there, it would have been a considerable quantity.

11,891. (*Mr. Guy.*) I should like to make one observation. I saw that some complaint was made immediately above my works, and that it was said that there was a considerable effluvium. It was caused simply by an obstruction in the watercourse, so that the water, instead of running down at a rapid rate, was retained, and it made this disagreeable smell. If what would be called a sud pond was made immediately below, that evil would be always in existence.

11,892. (*Chairman.*) You think that the remedy in that form would be worse than the disease?—Yes.

11,893. (*Mr. Harrison.*) But the water from your works flows into the Calder?—Yes.

11,894. And it carries that refuse with it generally?—Yes.

11,895. In the lower parts of the Calder there are works, and during a droughty season the refuse is exposed upon the banks of the river, and it is found to be a nuisance to people residing in the neighbourhood, therefore the nuisance which you have experienced at your own particular dwelling is actually experienced by many people lower down the river, almost everywhere, showing that under the present system the remedy is deferred?—Yes, everybody wants to get rid of the nuisance by giving it to someone else.

The witness withdrew.

Mr. Frederick William Cronhelm (Halifax) examined.

11,896. (*Chairman.*) What business is carried on at your establishment?—The name of our place is Canal Mills; it is chiefly a woollen mill, it is also a worsted mill. We have likewise a dyehouse and finishing works. In short we receive the wool into the works at one end and send out the finished goods

HALIFAX.

Mr. F. W. Cronhelm.

17 Nov. 1866.

in bales at the other. We have a complete arrangement for the manufacture and the finishing, including the dyeing.

11,897. Where are the works situated?—Close to the canal.

11,898. What is the canal known as?—It is the Calder and Hebble Navigation.

11,899. Do you use the water of the canal for your manufacturing purposes, or merely for traffic?—We use it partially when we are very short of water. We have permission to use it, but we refrain from using it as much as we possibly can, inasmuch as the water is not so pure as we get elsewhere.

11,900. What number of hands do you employ at your works?—The whole number is about 500, more or less.

11,901. Have you steam power or water power?—Only steam power.

11,902. Do you know what power you employ?—You are aware of the distinction between nominal horse power and real horse power. We have three steam engines, and the nominal power is 120 horse, but we consider it fully equal to double that, or 240 horse.

11,903. What weight of coals do you consume per annum?—In preparing to answer this question, I took the average of several years, and I found the average to be 4,500 tons.

11,904. What do you do with the ashes from the consumption of that coal?—I must explain to the Commissioners the position of our works. Part of the works are on the north side of the canal, close to the canal; on the other side of the canal we have the dye-house, the duling room, and the finishing works; those are situated between the canal and the river Calder. Then eastward from our works we have a large holme, which lies very low, and in flood times it is a complete lake, as was the case yesterday. We endeavour to raise the level of this holme so high that any extension of the works eastwards should not be subject to floods or encroachments from the river, therefore all our ashes are brought on to this holme, and we gradually cover its surface and elevate its level.

11,905. Have you at all protected the water so that the ashes shall not fall in, or be washed away by flood waters?—Entirely so.

11,906. You do not pass them into the watercourse?—Not at all; we take them in carts from the furnaces, and spread them upon the holme.

11,907. Have you privy accommodation or water-closet accommodation for your hands?—We have both.

11,908. Does any of the effete matter pass into the streams or rivers?—No.

11,909. You utilize it?—Yes, it is carried away to a manure heap.

11,910. It is not passed into the stream?—No.

11,911. Do you carry on dyeing upon the premises?—We do.

11,912. Do you use dyewoods of various kinds?—We do.

11,913. Logwood and other woods?—Yes.

11,914. Do you use them in the chip and in the rasped state?—No, they are all in the ground state.

11,915. Do you extract the solid matter from the dye refuse before passing it down the stream?—There is very little solid matter left in the dye water, which passes into the river Calder, only the crude particles of the ground wood.

11,916. What weight of wood do you use per annum?—I am sorry that that question was not in the list of printed questions sent to me.

11,917. Do you use besides the dyewoods any chemicals, acids or alkalis, or soap?—Yes.

11,918. Do you know what weight of soap you use?—Neither the soap nor the oil is mentioned amongst the questions which I was appointed to answer.

11,919. Do you utilize any of the soap refuse?—Yes, the soapsuds are restored to oil, and to a tallowy kind of matter.

11,920. Do you know what is paid to you per annum for the recovery of your soap waste?—Yes, I can tell you that to a penny, because we do not carry on the operation; we let it.

11,921. And the party to whom you let it pays you a rental for it?—Yes, there is a person who takes the soapsuds of several manufactories in our neighbourhood in the same way.

11,922. What does he pay you?—He pays us 60*l.* per annum.

11,923. You have not a very large weight of soap? No; the nature of our fabrics is such that they do not take so much soap.

11,924. How long do you remember the state of the canal and the rivers near your works?—About 70 years.

11,925. In what condition were they when you first knew them as compared with what they are now?—They were much purer than they are now. I remember when I was a boy fishing in the Calder, and it was a very great amusement for me, and I frequently caught fine trout and other fish, but now there is an end to all that.

11,926. Is the canal more impure than it was when you first knew it?—Undoubtedly so.

11,927. Do you think that it is still becoming more impure?—I consider that it is.

11,928. Is it a nuisance in dry weather as regards its smell?—The effluvium from the canal in dry weather is very offensive.

11,929. Have your workpeople ever complained of it?—Yes, they have observed it more or less, especially those who reside in cottages near.

11,930. Where do you get the water which you use for your manufacturing processes?—We get it partly from a large reservoir which we have in Skircoat above the works on the hill side, and partly also from a pump which pumps the river water into a cistern, not immediately from the river near us, but from what is called the Stannard; the stream of water permeates the river bed much higher up, and flows along what was formerly the bed of the river; there is a pebbly stratum over which it flows.

11,931. And you get your reservoir partially filled in that way?—Yes, it is certainly purer than the water on the banks near the works.

11,932. Have you any water supplied by any company, or from any artificial waterworks?—No; we have contemplated in droughty weather applying to the Halifax Company for a supply, but we have not yet availed ourselves of it.

11,933. Do you at any period sludge or cleanse the reservoir upon your own premises which belongs to you?—The great reservoir has not been cleansed or sludged more than once in a great many years.

11,934. Where did the refuse pass when you cleansed or sludged it?—It was flushed out by water into the canal; the canal is between our main factory and the reservoir; the river Calder is on the other side of our dyeworks.

11,935. What do the canal people say to you?—We never heard any complaint from them.

11,936. Do they dredge the canal by dredge boats?—They do.

11,937. Then any solid matters passed in would have to be dredged out by their dredge boats?—Yes; I very well recollect that the dredge boats have been long at work immediately opposite our works, and I think that they dredge about once a year.

11,938. Do you carry largely upon the canal; are you good customers to the canal people?—We are; we get the whole of our heavy materials, the whole of our coal, and a large portion of our oil by the canal; we contribute largely to the dues of the canal; we think that the canal people do not consider that sufficiently. I will tell you in what respect. For the better carrying on of our works we have several galleries or covered bridges between the great mill, which is on the north side of the canal, and the dyeworks and finishing works on the south side of the canal. I think that we have five or six bridges and covered galleries, and they have latterly began to claim a rate for the privilege of erecting these struc-

tures over their canal, though they do not in the least interfere with the navigation.

11,939. The canal company, I suppose, wish to have the right of stopping them if they choose ?—Yes, we pay them 10*l.* a year as bridge rent.

11,940. They would not have been content with 10 peppercorns ?—No.

11,941. (*Mr. Harrison.*) You say that you remember the Calder in former years in a very much purer condition than it is in now ?—Certainly.

11,942. Have you observed any difference in the bed of the river; has it risen at all ?—Very materially indeed. Besides our other mills we have two large mills higher up, called Mereclough Mills, one being Mereclough in Norland, on the south side of the Calder, and the other Mereclough in Skircoat, on the north bank of the Calder. The water power is exceedingly valuable; the Weir forms a river dam. We find that dam so materially filled up that I believe the water power has been reduced more than one half as compared to what it used to be. The depth at the weir head instead of being from 4 to 6 feet has, I believe, at times been reduced as low as 2 feet.

11,943. What is the character of the materials which you find in the bed of the river causing that raising ?—There is a variety of materials; great abuses are committed; ashes are thrown into both the river Calder and its tributaries, and all that is so cast into the tributaries goes into the Calder. But the greatest nuisance which we have found has been from the chemical works which are very near.

11,944. Where are they ?—There is only one set of works between the chemical works and the weir, and those are the gasworks; the gasworks are recent, the chemical works are an old establishment.

11,945. Do the gasworks send any refuse into the river ?—The gas water or the gas tar, when sent into the river, is very injurious to our dyeing, but it does not so much fill the bed. Opposite my counting-house I can see the whole bed of the river covered with a sort of film, which, when the sun shines upon it, reflects all the different tints; that is exceedingly injurious to our dyeing.

11,946. How long is it since you saw such refuse as that in the river ?—I have seen it within the last two months. I have twice written a remonstrance to the manager of the gasworks upon the subject; he has always apologised and said that it was accidental and should not be repeated.

11,947. But that did not remedy the mischief which was done to your cloth ?—No. In fact we had to stop the pump from which we filled the large cistern over the dye house; that pump is from the river water, not from the water immediately opposite our works, but from a well sunk in what we call the Stannard, the ancient bed of the river, through which the water still filters its way.

11,948. Do you find that the water so filtered by this ancient bed is improved by that filtration ?—Yes, but it commences far above the gasworks. When we see the film which I have described to you coming down the river we immediately stop pumping so as to keep the water pure.

11,949. You know that there is no excuse for the gasworks pumping any of their water into the river, those materials being so valuable ?—Yes, that has always been alleged. The gaswork are under the local board, at Sowerby Bridge, and the manager has always asserted to me in correspondence that it was quite unnecessary and was a loss to them, and that he would take every pains in his power to prevent it.

11,950. What refuse do the chemical works pass into the river ?—The chemical works formerly passed a dreadful amount of refuse into the river; all their ashes used to be poured into the river.

11,951. Do they do so now ?—No, we have prevented them from doing it.

11,952. How did you prevent them ?—The nuisance became so extreme that we applied to the Court of Queen's Bench for an injunction to restrain them from throwing any solid matter into the river. A writ was taken out in January 1863, and an injunction was obtained in the month following.

11,953. Since then have they not cast any of that matter into the river ?—They have not cast in any solid matter to my knowledge; indeed they immediately adopted a new plan for their refuse; they got a long boat on purpose to take it away. That boat is filled three or four times a week, and sent down the canal to a place which they have taken of the Lancashire and Yorkshire Railway Company, under the viaduct which passes to Halifax.

11,954. What do they do with the refuse there ?—They got leave or rented ground belonging to the company under those arches, nearest the canal, and they unloaded the boat and poured the refuse down there. But the effect of that is injurious; that refuse is so corrosive that I have heard that it is actually destroying the stone and eating away the piers of the viaduct.

11,955. So that it is the removal of the mischief from your neighbourhood to the railway company ?—Yes.

11,956. The railway company will be pretty sure to look after that matter ?—I should think so.

11,957-8. What water power have you at your two mills of which you spoke as having been reduced by the filling up of the river ?—I do not know precisely the water power which we had, but you may conceive the difference by the reduction of the depth of the dam head from five feet down to two feet. Our tenant Mr. Fielding is in the room, and he perhaps may be able to furnish the exact water power.

(*Mr. Fielding.*) The two wheels are 30-horse power; one is 20-horse and the other 10-horse. I became the lessee of those two mills in 1854; at that time our mill dam, I was told, would would take three hours in drawing off; we can now draw it off in 20 minutes very easily. The bed of the river is so dammed up with refuse from the neighbourhood above that we have no reservoir at all, but just simply the bed of the river.

11,959. That affects the question of the river acting as a reservoir for your works, but it does not necessarily diminish your horse power ?—Yes, it does very much so, because we are dependent for our horse power upon the river being cleaned. So much refuse and sludge comes down the river that we are more frequently in back water than we can run.

11,960. The river below is filled up as well as the reservoirs above ?—I fancy that almost every manufacturer sends stuff into this river.

11,961. (*To Mr. Cronhelm.*) Have you observed that the banks of the Calder are more flooded than they were formerly, in consequence of this rising of the bed ?—I cannot speak precisely to that point. I should conceive it to be a natural consequence of the bed of the river being filled up that the floods would increase.

11,962. You have mentioned that you put your ashes upon the land adjoining the river and raise it by degrees, or you make land of it; do you find that that land is better or worse than the land upon which you do not put your refuse ?—We have not yet begun to grow any crop upon the elevated part of the holme. We put some soil on the top of the ashes; as we extend the heap of ashes we dig away the soil and put that soil on to them. I should therefore conceive that it would be of the same nature as the field below.

11,963. I believe that you have paid a good deal of attention to the streams in the parish of Halifax ?—I have.

11,964. And you have written upon the subject ?—I can scarcely be said to have written upon the subject. I once wrote for a bazaar a little tract on the rivers and streams of Halifax, supposing a pedestrian to enter the parish from the west end and to walk up the Calder, and then to walk up the other streams, it was merely a little sixpenny pamphlet.

11,965. In what year was that ?—I should think that it was about 10 years ago. I do not precisely recollect.

HALIFAX.

Mr. F. W. Cronhelm.

17 Nov. 1866.

11,966. Could you then give a more flattering description of the rivers as to their purity than you can now give?—I should think so. If you will allow me I will send to my bookseller and get a copy of that pamphlet which I will put in to the Commission.

11,967. Have you taken any steps to diminish the nuisance to the neighbourhood from the smoke emitted from chimnies?—We send out no smoke; we burn all our smoke by Jukes's furnace. It used to be a patent, but the patent has now expired and it is open.

11,968. Do you find it effective?—Very effective.

11,969. And simple in management?—Very simple; but it requires some little attention on the part of the stoker. Whatever improvements are made in furnaces much depends upon the stoker, the man who puts in the coal. The stokers have it in their power by throwing on too much coal at once to diminish the efficiency of the plan. The nature of the application of the coal in Jukes's furnace is this: there is a flat iron table at the mouth of the furnace, and there is a door which descends, which would close it entirely; that door is a little elevated so that the coal which goes in is perhaps at an elevation of 2 inches. Jukes's principle is that of a revolving grate; the revolving grate takes the coal at the mouth of the furnace, and spreads it over the whole.

11,970. Do you find that you economise fuel by using that process?—Undoubtedly.

11,971. Have you made any experiments to prove that?—Yes; there are calculations as to the amount of coal which would be used on the common furnace plan and on our plan. The least saving is, I think, one-fourth; it perhaps may come nearer one-third, but as to one-fourth I feel positive.

11,972. And that without producing any smoke?—Without producing any smoke.

19,973. Did you hear Mr. Child mention just now that he had been obliged to remove Jukes's furnace?—At his own works at Copley, but he uses Jukes's furnace at his great mill in Bowling Dyke.

19,974. Do you think that he uses it with as much success as you do?—I believe that it is satisfactory.

19,975. To what do you attribute the obligation to give up the apparatus in the case mentioned by Mr. Child?—Mr. Child himself mentioned that there was a great deal of trouble in keeping things properly in order. For instance, the bars in the case of the revolving grate, which are perhaps about 10 inches, if they are not kept in regular motion they are apt to consume very fast, and to become very expensive; but with care and attention to the regular motions of the revolving grate, which may be regulated by a crank from the engine, we can make it revolve either quicker or slower. Unless due care is taken in that respect, for instance, if the bars are allowed to remain standing a considerable time when charged with burning coal they may be destroyed prematurely, and thus become more costly.

11,976. But with ordinary care you find that the whole apparatus works very satisfactorily?—Yes. Our engineer has told me that the bars of the revolving grates will last five, six, or even seven years.

11,977. (*Chairman.*) What weight of ashes do you get from your coal?—About eight per cent. of the weight of the coal is turned into ash.

11,978. And that has to be got rid of?—Yes, that is carried to the holme to elevate its level.

11,979. As you have described?—Yes.

11,980. What refuse matter do you throw into the Calder?—Nothing but dye water.

11,981. That is the coloured water after it has been used for dyeing?—Yes. As to the means of obviating that, they would be very difficult indeed. There are only two plans of doing so, one of which would be too expensive. That would be for all the dyers on the different streams to unite and to construct a culvert to take the water to the sea, about 100 miles off. The cost would be about 100,000*l.*

11,982. That would be a remedy, but it would be worse than the disease, because you would be taking the water from the river, and all persons using that water would object to that process?—Yes, there would be of course a diminution of that water. I listened with very great interest to the examination of Mr. Ingham, by whose evidence it appears that the purification of dye water is very unavailing; that it may look as bright and pure as the water from a spring, and may yet contain the objectionable ingredients.

11,983. It may contain acids and other chemical ingredients?—Yes.

11,984. That is the case with regard to sewage when it has been once passed into water. We have no means of separating the chemical ingredients but by spreading it over land to facilitate vegetable growth. Merely passing it through a sand filter would not remove them, but by passing it over land where there is a productive growth of Italian rye grass, the natural action appears to seize the salts of the sewage, and to assimilate them, and then the water combines with the alumina and clay, and other ingredients in the earth, and goes away comparatively pure water. So that by agricultural means you can really purify sewage until it becomes as wholesome as pure water. Taking Croydon, the sewage is day by day passed on to areas of land, and on one side you can see it passing in, dark and full of excrementitious matter, and on the other side of that land going off as bright as spring water, and a chemist can detect very little difference between it and the water of the river into which it flows, and which is soft drinking water, and trout have come there. But it is not every place that you can get land so favourably situated or of sufficient quantity?—It is a very interesting subject.

11,985. Is there anything which you wish to add to your evidence?—I believe that I have answered all the questions which are on my sheet. Had there been any others I would have given answers to them.

The witness withdrew.

Mr. J. Fielding.

Mr. James Fielding (Sowerby Bridge) examined.

11,986. (*Chairman.*) Where are your works situated?—At Mereclough Mills, Sowerby Bridge.

11,987. Upon what stream?—The Calder.

11,988. What number of hands do you employ?—Perhaps 50.

11,989. What business do you carry on?—I am a dyewood grinder and dealer. I occupy the mills spoken to by Mr. Cronhelm. I have two water mills on the Noreland and the Skircoat side of the Calder. I also live on the banks of the Calder.

11,990. Do you use water power for your purposes?—Yes.

11,991. And steam power as well?—Yes, we have about 30-horse steam-engines with water power.

11,992. What weight of coal do you burn?—That is uncertain, because we use the steam-engines as supplementary to the water power.

11,993. Is the water power sufficient when there is water in the river?—It has been sufficient, especially in the last six months, when we have had a great deal of water. We burn all the wood which we extract (we also extract dye woods); perhaps we consume six tons a week, burning them under Jukes's furnace, it is therefore almost impossible to say what coal we consume per annum.

11,994. What form of refuse is produced in your manufacture?—Ashes and wood, generally chip and rasp wood.

11,995. About what weight of that wood do you think you have per annum?—About 300tons per annum.

11,996. What do you do with it?—We consume it all under the furnace.

11,997. With the ashes?—Yes.

11,998. You have refuse ashes from the coal?—Yes, and we have a very small soot in the flues of the boilers which we clean out every month; we have to convey the soot upon our land, we mix it with our manure.

11,999. Do you pass any of your solid refuse into the stream?—Nothing whatever.

12,000. Do you use water for any purposes connected with your business?—Yes, in making our dyewoods.

12,001. Where does that water generally come from?—From the river.

12,002. Have you any water from the Halifax corporation?—None whatever at present.

12,003. Where do you get your water for boiler purposes?—From the river.

12,004. Do you condense?—Yes, we have a condensing steam-engine.

12,005. And you condense with the water of the river?—Yes, and then turn the water back again.

12,006. Are you near the canal which the last witness spoke of?—Yes, very near it.

12,007. Do you use the canal water at all?—On that side of the canal there is the Skircoat Mill where we use water power exclusively, and therefore we have no communication with our steam-engines.

12,008. How long do you remember the river and the canal?—I have lived there since 1854.

12,009. In what condition are the river and the canal as compared with what they were when you first knew them?—I was aware that the river was continually filling up with the rubbish put in by people above, and therefore I engaged with others to form an association to prevent people putting ashes and rubbish into the river Calder. We kept the association on for about two years, but it fell through because we had not strength to resist, not only the local board of health but the gasworks, and all the people above; they poured everything into the stream and thereby diminished our water power.

12,010. Do they continue to do so now?—They do so partially now. I have seen the local board of health wheel the road scrapings right into the river. I have known them allow rubbish of all sorts to be put into this river; it is well known that our local boards of health are generally interested in filling up this great sewer, in fact the river Calder has now become now the great common sewer of the district.

12,011. In what state is the canal?—The Calder and Hebble Navigation is generally a black stream because there are many dyeworks upon it. The last witness told you that he poured his dye water into the canal, and so do the persons next to him; it goes in as black as ink, the water is generally very filthy.

12,012. Is it offensive in dry weather?—I have been told so; I live on the banks of the Calder, and we are very much annoyed with what is continually coming down this river. In fact so late as last Sunday there must have been something from the gasworks, because every room in my house was filled with a most horrible stench, and very frequently the men working in my mill have been obliged to come out for fresh air, they have been almost suffocated with the stench from the gas water.

12,013. If there had been a river conservancy to whom you could have appealed, I presume that you would have set them in motion very rapidly against these offenders?—I should be very glad if it could be done, because nothing else but that can compel manufacturers to keep out their refuse, nothing else than the strong arm of the law. We tried it for two or three years, but we broke down for want of strength. We won one trial, and lost a second, and could not carry the matter on any longer, and broke down; in fact no man likes to injure his neighbour; a man dares not come forward and sign an affidavit that his neighbour does this, that, and the other, because it is so difficult to compel him to desist. People have promised that they will desist, but they do not, and in my opinion nothing but the strong arm of the law will suffice.

12,014. As the law now stands, in order to interfere with these proceedings, it requires that one neighbour should indict and prosecute another?—It does.

12,015. Do you think it advisable that some new regulations should be established by which an independent body should take charge of these proceedings and so prevent that unneighbourly act?—I am quite sure that that is the only mode which can be adopted to prevent this river having all sorts of pollution thrown into it, that has been my opinion for years.

12,016. Then you think that persons who pour their solid refuse into a river should be prevented from doing so?—Yes.

12,017. And you think that pouring gas refuse into the river should be prevented?—Yes.

12,018. And if any persons in your trade sent in solid refuse you would say that the law should prevent them from doing so?—Yes.

12,019. You find that you can and do carry on your trade without sending in any solid refuse?—Yes; even as regards our privies we have generally ashpits, and the soil goes on to the land.

12,020. You have been impeded in your operations by the filling up of the bed of the river?—Very much so indeed.

12,021. Supposing that you wished to restore your mills to their original power, have you any idea what it would cost you to carry down the bed of the river to its original level?—All the hollows or pot holes are choked up so that we are compelled to clean them out; we do that every summer. Some of the contents we take where we can and some we let pass down to our next neighbour.

12,022. Then you would come under the lash of the law, if the law were put in force so far as regards that?—Certainly. We should be very glad to join in any scheme which could be adopted for carrying that refuse down to the sea.

12,023. Or for keeping it out of the river altogether?—Yes. The dyers, so far as I have heard, all say that they cannot keep out their dirty water, but I think that they ought to be compelled to do so as far as possible.

12,024. (*Mr. Harrison.*) As an extractor of dyewood, could you suggest any means by which refuse might be kept out?—I was surprised to hear the evidence of Mr. John Ingham, of Bradford, where he said that 600 tons of chips entered the river. Why not burn them?—We burn all our logwood chips and all our fustic chips, and all our American bark which we extract.

12,025. They all admitted that they could burn the chips, but the difficulty was with the rasped wood?—I think that they ought to be taken away and burned. No doubt that rasped wood after they have got the colour out of it is very injurious to the river, because it will fill up and make a large bed.

12,026. (*Chairman.*) I suppose that a filter would strain out the solids of the rasped wood?—It would. Some people set fire to it, putting it upon a heap and burning it. It is not at all impossible to keep it out of the river, they might as well burn it as not. I apprehend that many gentlemen will say that they do burn it.

12,027. (*Mr. Harrison.*) Can you state what weight of dyewoods is used for the purpose of dyeing?—No. This is a large district for its consumption. I myself grind from 60 to 100 tons a week, and that is all consumed in the neighbourhood; that is chip and rasped woods.

12,028. If you valued the injury done to your two mills by the filling up of the river, what should you put it at?—We should have to deepen the river. I conceive that the last day or two has shown the people the folly of putting in so much rubbish, because thereby the river is made so much shallower, and when a flood comes it destroys all your property.

12,029. Do you know from your own experience that that has been the effect of the filling up of the bed of the river?—Yes. Yesterday I was up in the valley of Todmorden. I came down by the railway there, and I was astonished to see such havoc. The turnpike road and the river and the canal were all level with the water; they were impassable for miles, and I have no doubt the damage will be very serious indeed.

12,030. Do you know Todmorden?—Yes. They are in the habit there of building their privies over the river, and all the refuse comes down this river, and the river has been choked up there many times. They

HALIFAX.

Mr. J. Fielding.

17 Nov. 1866.

deserve all they get, because they have sinned with their eyes open; they have kept building, and throwing in, and throwing in, and they have told us as an association in 1864 that they had done so and would do so.

12,031. Then you cannot help looking upon the devastation with a little satisfaction?—The last witness and myself waited upon them, and we waited upon all the millowners, and tried to persuade them not to do so, but to think of their neighbours, and of those people who suffered below, but they said that it was a right which they had, and a right which they would maintain, and therefore we gave our attempt up; our association fell to the ground.

The witness withdrew.

Mr. T. Hastings.

Mr. Thomas Hastings (Stainland) examined.

12,032. (*Chairman.*) What business do you carry on?—I am a paper maker and cloth miller.

12,033. Where are your works situated?—In Stainland.

12,034. Upon what stream?—Upon the Blackburn, and a small stream running through Stainland, the name of which I do not know. I have always called it the Stainland Beck.

12,035. Are they two separate works?—Yes.

12,036. Are they both of the same character?—No, one is for paper and the other is for milling cloth.

12,037. In the paper works what number of hands do you employ?—From 40 to 50.

12,038. What tonnage of paper do you make per annum?—About 200 tons a year here. We have large works in Leeds where we make a great deal more.

12,039. Do you know what volume of water you use for that purpose?—I should think that we use about 7,000 gallons a day, that is for the paper mills.

12,040. Out of what do you make your paper?—Linen and hemp.

12,041. Is it a fine quality of paper?—No, it is paper for pressing cloth.

12,042. Do you use any Esparto grass?—Very little.

12,043. Do you make your pulp upon your own premises?—Yes.

12,044. You do not purchase pulp from any other place?—No.

12,045. What becomes of your waste refuse in washing and cleansing?—It goes down the river.

12,046. Have you privies or ashpits?—Privies.

12,047. Where does the refuse from the privies go?—On to land.

12,048. You do not pass it into the stream?—No.

12,049. Are there any works situated above you?—Yes.

12,050. What are they?—There are both worsted and cotton and woollen works.

12,051. Do they dye?—Yes.

12,052. And do they taint the water as it comes down to you?—Yes.

12,053. Do any of them pass in ashes or other solid refuse?—Not to any great extent. I have known it done, but I do not think that it is done so as to be objectionable. If they wanted to get rid of an extra cartload of stuff which was in the way it might find its way into the stream, but I do not think that it is regularly done.

12,054. Do you use water power?—Yes.

12,055. Is it at all impeded by the casting in of solids?—No, I cannot say that it is; it probably costs me a few pounds extra in cleaning out my dam.

12,056. Below your mill-tail has the bed of the river at all been filled up with refuse?—It was a few years ago, but I took the tail goit a little lower down, and I have not had any inconvenience since.

12,057. What weight of lime do you use in bleaching?—Perhaps about 5 tons a year.

12,058. And what quantity of sulphuric acid?—I cannot say. We do not bleach much, but we use lime for boiling.

12,059. Do you filter the water at all?—No, we used formerly to run it on to a piece of holme land which we had.

12,060. After it left you?—Yes.

12,061. That was for irrigation?—Yes.

12,062. With what effect did you do so?—It produced a luxurious crop, but the grass was coarse. The difficulty with refuse from a paper mill is that a very considerable quantity of the fine fibre of the rag goes away with the water, and if it is not very carefully watched it has a tendency to destroy vegetation rather than encourage it.

12,063. Have you heard of a recent filtering process by a Mr. Needham, for taking out that refuse from the water?—No, I have not seen or heard of anything of the kind.

12,064. There is a patent press at work by which you could recover every atom of that material; you could recover the finest possible fibre in the shape of pulp, and at a cost which would pay you handsomely?—It would still have the dirt along with it.

12,065. That press is for the pulp which comes from the machine?—My mill here is a hand mill, and we do not allow much of that material to go. I know that there are savealls for that purpose, which can be used, but we do not allow much material to go. It would not much affect my water; it is worked over again. When you are washing rags, before you can get them clean a certain amount of fibre always goes with the dirt, and if you got it you would only have the dirt over again and it would be of no use to you.

12,066. But if it was of no commercial use yet you could extract it?—I have not seen any machine which would do it, on account of the great quantity of water which it must go through.

12,067. This same machine is used by the potters in Staffordshire and other places to extract their clay; they pump the water with the clay in solution into one of these machines, and they can solidify the clay at a cost of about 2*s.* 6*d.* a ton. There can be nothing in your refuse which would be half so difficult to separate as a solution of clay. Do you know what is the proportion of water which is required in your manufacture?—I do not; it depends very much upon the kind of paper and the extent of washing. Some kinds of paper, the coarser kinds, require a very small quantity of water; but if you require to bleach the material, or to wash it thoroughly for bleaching purposes, you must have double or treble the quantity of water.

12,068. Do you know the large paper works which belonged to Mr. Crompton?—I do not know the works, but I know the name.

12,069. The proportion usually taken is 1,000 lbs. of water to 1 lb. of paper?—Yes. I may be wrong in the quantity of water which I have given as that which we use because I was not prepared for these questions.

12,070. Have you made yourself acquainted with what Parliament has done with respect to paper making on the Thames?—No. I have seen that there is an injunction against McMurray of Rickmansworth on a tributary of the Thames.

12,071. Is that very recent?—Yes.

12,072. Have you seen the Thames Conservancy Act passed in the last session?—I heard of it.

12,073. There is an Act of Parliament in which definite restrictions are to be put upon paper making on the river Thames?—I will get it.

12,074. What is the other manufacture which you carry on?—Fulling cloth.

12,075. Where is that manufactory situated?—The two establishments are near together.

12,076. How many hands do you employ there?—Only a few.

12,077. Have you any refuse of any sort?—Yes, there is a good deal of dirty water from the scouring of the cloth.

12,078. Does that pass down the stream?—Yes. I made two filters in a coarse way, to see whether I could not pass the water through clear to the stream, but they very soon got choked. Then I

mixed a small quantity of lime with the water as it ran away from the machine, and I found that it deposited much quicker with the lime than without it; but still I found a very great difficulty in making the water at all pure, besides it created a great nuisance on the premises. I have plenty of room, but a foot path goes past my works, and I was afraid of being indicted for a nuisance.

12,079. So that you pass that refuse away now as you did before?—I do. I partly run it on land, but we cannot run it on land all the year round.

12,080. Why not?—Because we cannot do it during the hay season.

12,081. If you tried a small portion of land with Italian rye grass you would find that you could grow Italian rye grass all the year round; you could irrigate all the year round, and you could cut grass all the year round, excepting when the surface was covered with frost and snow, and then you might put the refuse upon the surface; if it froze it would be all right; if it saturated the snow it would be all right, and when a thaw came it would not be a nuisance. At Croydon they always irrigate?—I presume that they cut their grass and use it green.

12,082. They do, and it is most beneficial when used for milch cows; it produces the largest amount of milk and the best butter. Have you any further observation to make?—I have this to say. The stream above me, the one coming down from Stainland has become very foul indeed, and the smell is quite a nuisance. I complained to the manufacturers above me, and they agreed to send the dirty water past me. This has not been carried out, but I have no doubt that it will be, unless there is some regulation about passing dirty water into the Calder. My impression of the way to get rid of this difficulty is the same as Mr. Cronhelm's, namely, that you must send a dirty stream and a clean one side by side, and I think that the quantity of dirty water which would require to be passed down a dirty stream is not nearly so great as the general impression represents it to be. It is only for two or three months in summer that the stream would feel the withdrawal, and I presume that there is more water coming down from these compensation reservoirs in the Halifax district than ever came down the Hebble in a dry time before those reservoirs were made.

12,082*a*. Then you think that the true solution would be to make intercepting drains, and to take the water away?—I do.

The witness withdrew.

Mr. John Crossley (Halifax) examined. *Mr. J. Crossley.*

12,083. (*Chairman.*) In what business are you engaged?—I am a dyer.

12,084. Where are your works situated?—At Bailey Hall upon the Hebble.

12,085. What number of hands do you employ?—From 150 to 200.

12,086. What weight of material do you use in the shape of solids?—Of dyewoods, such as logwood, fustic, and peachwood, we use about 200 to 300 tons in a year.

12,087. What weight of sulphuric acid and lime and other bleaching material do you use?—We use about 5 tons of soda ash, 10 tons of soda, 20 tons of ammonia, and about 30 tons of acids in a year.

12,088. Have you steam power?—Yes.

12,089. What horse power have you?—Our steam-engine is called 12-horse power.

12,090. What weight of coal do you use per annum?—We use nearly 20 tons of coal per day.

12,091. Do you know the weight of the ashes?—We generally take away about 3 tons of ashes per day.

12,092. What do you do with them?—We lead them to the railway station principally.

12,093. You do not pass any into the stream?—None at all.

12,094. What volume of water do you use per day?—We pump from the wells about 150,000 gallons, we have two wells on our premises.

12,095. To what depth are they sunk?—The one is 10 yards and the other 20.

12,096. Do they vary at any time of the year?—They do not vary very much.

12,097. What is the quality of the water?—It is hard.

12,098. Then is it injurious for your purposes?—No; it does very well indeed for dyeing and cleansing purposes, but we use a little of the corporation water for scouring, it saves soap.

12,099. How much of the corporation water do you use?—About 8,000 gallons a day.

12,100. At what price?—I forget now; I think that it is about 8*d*. at present.

12,101. What weight of soap and oil per annum do you use?—Perhaps about 4 tons of oil per annum, and about the same quantity of soap.

12,102. Do you attempt to extract any of it from your waste water, after you have performed your washing operation?—We do not extract either oil or soap.

12,103. Then it passes away with your refuse water?—Yes.

12,104. Do you extract the solid parts of the dyewoods, after those dyewoods have been used?—No, except that there are some articles, such as sumach and divi-divi, and that sort of article, which are used in cotton for the warp, and which we take and mix with the night-soil. Of the chip wood we do not use 1 cwt. in 12 months, and any chip wood which we do use we burn.

12,105. Have you waterclosets or privies?—Privies.

12,106. What becomes of the refuse?—We take it on to land and mix it with vegetable refuse.

12,107. You do not let it go into the stream?—No.

12,108. (*Mr. Harrison.*) What weight of wool do you use?—We do not dye wool as wool, but we dye piece goods. We dye perhaps 4,000 or 5,000 pieces a week when we are busy; at present we are not dyeing so many as that. They vary from 5 lbs. to 20 lbs. each. The average weight, I should think, would be about 10 lbs. Some of these goods are mixed cotton warps and wefts, and the others are all wool.

12,109. (*Chairman.*) Are there many works similar to yours situated above you?—Yes, a great many.

12,110. In what condition is the water of the Hebble as it comes down to you?—It is very bad.

12,111. Is it worse than it was when you first knew it?—When I first knew it it was as clear as spring water.

12,112. Would it be a benefit to you if it could be rendered clearer than it is now?—Without doubt.

12,113. Should you then be able to use it for your washing purposes?—If it was clear we could use it for both dyeing and washing.

12,114. Can you use it now for either of those purposes?—We occasionally can use it for dark colours. Yesterday we were obliged to stand. We generally use it for condensing purposes, and for steam power, but so many ashes and things of that kind come down that they very frequently stop the pump.

12,115. Then some persons do throw ashes in above you?—There is no doubt that ashes do get in somewhere above me.

12,116. And you find them out in your pump?—Yes.

12,117. Do you think that it would be proper to prevent persons who use the streams from pouring in ashes?—I think so. We used to have a society which professed to look after the matter, and to fine every one who put ashes in, but I do not think that much has been done lately in that respect, at the same time the stream is better now than it was before the Ogden reservoir was formed.

12,118. I suppose that many of the large manufacturers do keep their ashes out of the stream?—I believe that they do their best to keep the stream as clear as possible.

12,119. And perhaps to a greater extent than they did 10 years ago?—Certainly. Since I remember you

HALIFAX.

Mr. J. Crossley.

17 Nov. 1866.

could go up and see ashes on both sides of the river, and as soon as a fresh came they were taken away; we did so ourselves in Wheatley. The roads in Wheatley at that time were positively full with ashes. The surveyor used to come to our works and say "I want a small quantity of ashes," and we put them there, but if heavy rains came they were washed down the roads and we knew that they must go down the stream.

12,120. (*Mr. Harrison.*) Did you hear what Colonel Akroyd said yesterday about purifying the dyewater?—No.

12,121. He said that he had tried experiments, and that the addition of lime would throw down the colouring matter which was in suspension, and the water would pass off in a comparatively pure state, and that that machinery only occupied a small space?—It would be possible, I think, to do it at small works, but not at such works as ours and Kirks.

12,122. If it could be shown that it could be done in a small space, would it be a benefit to you, and to all dyers, to carry it out?—I think not; some years ago we tried to precipitate iron and other matters in the water with lime, and the action was so irregular that it was very difficult to get the colour which we wanted; sometimes when we wanted a purple we got a red. Although the water is clear to the eye, yet it contains acids, and alkalies, which are a great detriment to us when we come to use it.

12,123. Any system of that sort would not assist you for dyeing purposes?—Not so far as I see.

12,124. Would it be useful for cleansing purposes?—It might for cleansing some things, though if one portion of the water contained acid and another alkali it would vary the shades of colour.

The witness withdrew.

W. H. Rawson, Esq., J.P.

WILLIAM HENRY RAWSON, Esq., J.P. (Halifax), examined.

12,125. (*Chairman.*) In what business are you engaged?—We are manufacturers and merchants.

12,126. Manufacturers of what?—Woollen cloths.

12,127. Where are your works situated?—At Mill House on the Ryburn Brook; we have other works in Ovenden.

12,128. What number of men do you employ?—Perhaps 700 or 800 men and women taking the two works together, but I cannot recollect the number exactly.

12,129. Do you use water largely?—We use a good deal of water.

12,130. Where do you obtain it from?—We have large springs of our own from the hill side, the water from which is collected in reservoirs of our own, and we also have the Ryburn Brook.

12,131. Then you use the brook water?—Yes.

12,132. Do you use steam or water power?—Both steam and water power.

12,133. What horse power and what water power have you?—To the best of my recollection we have about 60-horse steam power, but it varies a good deal, being in conjunction with the water power; I am not able to give a definite answer to that question, because my object is merely to give evidence upon the smoke nuisance; I came unprepared with other details. The amount of our water power depends upon the amount of water in the river at the time.

12,134. Have you found your water power at all impeded or interfered with by solid refuse coming down the stream from above you?—Not particularly, except that Mr. Morris, our neighbour above, annoyed us a little with solid refuse, but I think that he has remedied that now.

12,135. What extent of engine power do you use?—About 60-horse power altogether.

12,136. What weight of coal do you burn per annum?—About 3,000 tons, if I recollect rightly; we burn about 45 tons a week at Mill-house works.

12,137. What becomes of your ashes?—We generally use them or they go upon the roads; we never turn a single ash into the river except there happens to be a heavy flood and then a few go over; we have a great extent of roads, and the surveyors take the ashes away to repair the roads.

12,138. You do not systematically tip ashes into the stream?—Never.

12,139. Do you think that any manufacturers in Yorkshire do so?—I am afraid that they do; but I do not wish to speak evil of my neighbours.

12,140. Do you believe in the possibility of smoke prevention?—There is no doubt of it.

12,141. Have you had experience in preventing it?—We have prevented it for the last 10 or 11 years.

12,142. Do other manufacturers prevent it?—I am sorry to say that they do not generally, but they are beginning to do so to some extent.

12,143. If they are left to their own devices do you think that so good a practice will be followed?—It is difficult to say.

12,144. Would you make it compulsory that they should prevent smoke?—I should.

12,145. What means have you taken to prevent smoke?—We have Jukes's furnaces exclusively.

12,146. How long have you had them?—We began to work with them 11 years ago, and for several years we have had nothing else.

12,147. Do you know what was the cost of applying that process to your boilers?—We made a good many improvements of our own, and I should think that the whole cost to us has probably been about 120*l.* a boiler. I should say that it could be done cheaper now. I think that it could be done for about 100*l.* a boiler over and above the cost of an ordinary furnace, and adopting every improvement.

12,148. Of what size would those boilers be?—About 30-horse power.

12,149. Would they be 6 feet in diameter?—I think that ours are 7 feet in diameter.

12,150. Of what length are they?—28 feet.

12,151. What does the patent consist of?—Jukes's patent has expired.

12,152. What does the arrangement consist of?—We have ourselves made a great many improvements.

12,153. Can you describe briefly what the arrangement is?—It consists of revolving grate bars, and the coals are carried gradually forward. The fire is fed by a hopper. The coals are fed about every 40 minutes by the fireman upon this hopper, and are gradually moved forwards on the fire, so that no smoke is made. The coal is ignited the instant that it approaches the fire; it is ignited by a brick arch above.

12,154. The material is roasted out of the coal, and turned into a flame immediately?—Yes; no smoke is made.

12,155. Can you maintain your steam power as efficiently by that process as by the ordinary mode of firing?—Undoubtedly.

12,156. If any person told you that it was impossible to carry on his trade without making smoke what should you say?—I should simply say, "I am sorry that you are so ignorant." We have done it ourselves for 11 years, and I think that I can speak with some practical knowledge upon the subject.

12,157. When you began it did you believe that you could do it?—No, nobody was more bigoted than I was in the first instance, 10 or 11 years ago; I did not believe that it could be done.

12,158. You were determined to try?—Yes, for these reasons: that I have very extensive gardens and conservatories round me, and I was so thoroughly beaten by the smoke nuisance upon my own premises that I was determined to carry out this process for my own benefit.

12,159. Then your interest lay in the consumption or prevention of your own smoke, and your intelligence forced you on?—I saw that it could be done, common sense showed me that it really could be done.

12,160. Your belief lay in that direction?—Undoubtedly; I believed that it could be done, but I was at first afraid that it would be done at a very great expense. I was afraid that expense would be a stumbling block.

12,161. Do you find the apparatus all injurious to your boilers?—Not in the slightest degree.

12,162. Do you find it more expensive than if you fired in the ordinary way?—It is a great deal less expensive.

12,163. Does it save you in weight of coal?—In our own case it saves at least 20 per cent. of coal, and there I think that I am under the mark. I think that I might venture to say 25 per cent., but I will say 20 per cent.

12,164. Then if 100,000 tons of coal are carelessly consumed in Halifax, producing this intense amount of black smoke, 20,000 tons might be saved and no smoke made?—Undoubtedly; I will give you the results of it in our own experience at Mill House. We formerly always had five large boilers in work, and since we have adopted Jukes's patent, we have done away with one of those boilers, and have sold it; before we always had four boilers in operation and one standing, since the application of Jukes's patent we have never had more than four boilers, namely, three in operation and one standing, and I should think that we have been making 20 per cent. more steam with those three boilers than we did with the four before.

12,165. We will cease to talk about Jukes's patent because patents frighten people and we will call it Jukes's apparatus as modified by your arrangement. You have no hesitation in saying that where coals have to be used, and power has to be obtained, you may consume the coals and produce the power without generating dense smoke?—Undoubtedly; I am only speaking of our own case, we make no smoke.

12,166. The law must sweep away what people say is impossible in that respect?—I am afraid that that is what the law will have to do; certain remarks were stated at the Bradford Town Council to have emanated from yourself. It was said there by some one or other that you had stated publicly that the burning of smoke entirely depended upon the stoker; that there was no system which had come out, and that you didnot know of any system which would come out, which would effectually burn smoke without the result depending upon the stoker; and that you would undertake to work any mill in Bradford without any dense smoke. That you might do, but I could not allow these remarks of yours to go unchallenged before the public, because it is more than likely that many persons would be very glad to shelter themselves, and would say, "There is Mr. "Rawlinson, the Government Commissioner, who says "so and so." I wrote to the "Leeds Mercury," and I quoted these remarks, and I said, "Will Mr. Rawlinson "himself admit that he actually stated such facts?" It is very desirable that the public should know whether that is so or not, and I cannot allow those statements to remain unchallenged.

12,167. I will admit it in this way, that with regard to Jukes's patent we have had evidence that persons have tried it and have pronounced it to be a failure, and have abolished it because they have said that it did not serve the purpose which was intended. I said that patents might be put in use, and might be so managed as not to accomplish the purpose, but that in every case (and I say it advisedly now) it might be done by careful firing. I believe that your boilers might be worked as economically and with as little smoke by careful firing as by your arrangement. I know establishments which have been carried on for years, simply by an arrangement with the fireman that he should not generate smoke, but should be paid extra for not producing smoke, and he has accomplished the purpose. There is no witchcraft in the arrangement, for Jukes's patent is simply putting the coal near the front of the fire near to the door, near to the dead plate, and drawing it evenly and continuously towards the bridge, and always firing upon the front?—Just so.

12,168. If I owned steam boilers my workmen should all do the same by hand?—If you will excuse my saying so, if the matter is to be entirely dependent upon the stoker himself, it will never be done, but in Jukes's system you have a self-acting apparatus which does it independently of the stoker, and it cannot go wrong.

12,169. (*Mr. Harrison.*) In Jukes's process you get rid of the opening of the door?—Yes, the front of your boiler is in a measure hermetically sealed, and the stoker seldom has to look at his fires from morning to night. In the last trial which we made, he never touched his fires for 48 hours, during which time we made an experiment as to the amount of water evaporated.

12,170. (*Chairman.*) An arrangement was put into operation when I was a boy; there was then a revolving disc like a great coffee mill in front of the boiler, the small coal was scattered in front and there was a self regulating arrangement acting from morning to night. As soon as the steam had risen to a certain height, a strap was thrown off a fixed pulley on to a loose pulley and the matter regulated itself. What has become of that process I do not know?—In Jukes's patent no air is admitted in front, and no door has to be opened, there is no cold air to throw down the steam, the fire gets no air excepting underneath and through the bars.

12,171. If there is to be a government regulation with regard to the prevention of smoke, do you not think that it would be more advisable simply to say that smoke shall be prevented, and to say nothing about the means?—Decidedly.

12,172. Because there may be other means?—Certainly; I only speak from our own experience. I say that it can be done, and is done, and ought to be done; I should say, let people take their own course.

12,173. They will then have no excuse?—Just so; in the first place you will have no smoke, you will also make a saving of at least 20 per cent. in fuel, and where you have a large number of boilers I believe that you will make an enormous saving in stokers' wages. If you have 20 boilers half the number of men under Jukes's system will work those boilers, as compared with the Cornish system of boilers, and it will be with one-fourth of the labour to themselves.

12,174. I am extremely glad to hear this evidence from you, and I at once accept it as proving a fact which has been put to the test of experience and has been corroborated by others, and which therefore shows that those persons who have put in operation, as they say, Jukes's patent, and have paid their money, and then have abandoned the process, have either allowed their firemen to deceive them, or have been so careless that they have paid no attention to them?—That is the case.

12,175. I think that if you have seen the tenor of my remarks you will perceive that this is what I said?—Those remarks were made three or four months ago, some of the members of the council stated what you had said, and I said, "Whether or not Mr. Rawlinson "stated so, it is desirable that the public should know "whether he did state it or not."

12,176. I state now what I have stated before, that smoke consuming is in some respect a matter of faith. I never yet knew any establishment where steam power was used where smoke consuming could be established if the head of the firm did not believe in it. Only show me an individual and let him tell me, "It is of "no use your talking to me, I have tried to consume "smoke, and I do not believe in it, and know that it "cannot be done," and I am quite aware that it will not be done in that firm; but I go to another establishment (and this I have learned above 20 years since) the head of that firm acquaints himself with the conditions necessary to smoke burning; he establishes his own faith from conviction, and he says, "I know that "it can be done, and it shall be done," and then it is done?—It was done by me in the same way, but in many cases failure arises from the stupidity and ignorance of the stoker. I was determined, 11 years ago, to be the master. We had a very stupid old engineer who had been with us 20 years; a very clever intelligent man was at the other end, and the stupid fellow said, "What "do you know about this? I have known about this "before you were born;" and he threw every obstacle in the way. I went to him and said, "I am to be the "master and not you, and on this day fortnight you "leave, and the stoker under you." I was sorry to be compelled to do it. That is 11 years ago, and that man is with me now, and his stoker also, and he would give his head rather than go back to the old system.

HALIFAX.

W. H. Rawson, Esq., J.P.

17 Nov. 1866.

12,177. That quite agrees with what I have said. I have said that when there is the intelligence to insist upon good and careful firing, you may fire an ordinary boiler and not generate anything more than what is called parliamentary smoke, but you must pay for it, insist upon it, and have it done?—You would require double the number of boilers to do it. In Jukes's system there is the advantage that you have a continuous furnace all day long, always generating steam; but if you do it as you propose, you must double the number of boilers and fire very lightly.

12,178. That I refute?—I am afraid from my own experience that you will find it so. I have not a doubt about it.

12,179. The law is not always clear; some Acts of Parliament have said in their clauses that persons shall provide themselves with apparatus capable of preventing smoke. The law makers thought that by that arrangement smoke was to be prevented. What has been the effect? Persons have been summoned for a smoking chimney, and they have pointed to this clause in the Act of Parliament, and have brought forward their witnesses to prove that they have had the apparatus, but that the stoker was careless, and the magistrates did not convict?—But I think that the law will have to say by and bye that you shall do it.

12,180. And to let the fine be cumulative?—Yes; it is the interest of the parties to prevent smoke on account of the enormous saving to them.

12,181. (*Mr. Harrison.*) What weight of coal do you use per annum?—At this mill 45 tons a week has been our average, and I will engage to say that it would take in many places 90 tons to do the work which we do.

12,182. That is 2,340 tons per annum?—Yes.

12,183. What do you give for that coal per ton?—I suppose that it is now about 8*s.* 6*d.* a ton, but the price has been advancing so much that it is almost impossible to say.

12,184. That would be about 1,000*l.* a year, and that is divided among four boilers?—Four boilers, but only three always in work.

12,185. That would be 333*l.* a year for each boiler?—Yes.

12,186. And you say that you save a quarter of the coal; therefore, you save one-fourth of this amount?—Yes.

12,187. That would be upwards of 80*l.* a year which you save?—Yes, as compared with what we formerly burnt before we applied this process.

12,188. That is 80*l.* per annum saving upon each boiler, whereas the apparatus you say only costs 100*l.* to put up?—It would, I suppose, be about 100*l.* now in excess of the ordinary furnace.

12,189. Therefore, the saving in about a year and a quarter would pay for the expense of putting up the apparatus?—Undoubtedly, and in our own case we have no trouble whatever; this goes on from year to year; we have no outlay for damage. I can show Mr. Rawlinson a boiler which has been going on for about four years, and has not had a penny expended upon it.

12,190. (*Chairman.*) But if you had not been gifted with a little faith, and a good deal of obstinacy, you would have been beaten?—Yes, but I was not to be beaten, and I think that I have been the means of introducing a good number of these furnaces into this district since. There is another point to which I should like to call your attention, and that has reference to the ashes which are made. I happened to read the evidence of many of the Bradford manufacturers the other day, and I see that by their statements they make nearly 1/4th of ashes. By Jukes's process in our boilers we scarcely make 1/20th of ashes. I may say that we do not make more than 1½ cwt. of ashes for a ton of coal by using Jukes's process. That shows you at once the enormous saving in the coal; the coal gets so thoroughly burnt that nothing is left. In the last trial which we made, about 6 tons of coal made I think 6 cwt. of ashes.

12,191. Have you tried anything with your domestic fires to economise coal and to save smoke?—Nothing whatever, as coal is so cheap in our part of the world.

12,192. Let me tell you how you may save half your coal, and produce no smoke, and have a far better fire?—I can easily believe it. I do not think that any plan will ever answer which is merely dependent upon the intelligence of the stoker. It must be self-acting so that he cannot go wrong. I am now speaking of boilers.

12,193. Is there anything further which you wish to add?—No; but I shall be delighted if I can show you these boilers worked as they ought to be worked.

(*Mr. Fielding.*) I also have two of Jukes's furnaces, and I have just replenished with new grate bars one boiler which has been at work 12 years. I should wish to say that once replenishing will make them last for that time.

12,194. (*Mr. Harrison.*) Do you produce a saving of coal?—Yes.

12,195. (*Chairman.*) Have you had the same arrangement with your firemen?—Yes.

(*Mr. Rawson.*) There was a great objection to this external firing. You asked me whether we had had any injury with the boilers. We have only one boiler on our premises which we consider a bad boiler. We always get the best Low Moor boilers, which we consider the cheapest in the end. We have one boiler which we contracted for 10 or 12 years ago—a Lancashire boiler—which we considered a bad boiler, and we had a good many repairs to make to it. That condemned boiler has been going 10 years with Jukes's apparatus, and is as good now as it was then. Unfortunately, in the present day, the workpeople set their faces against anything which will do the work more quickly.

The witness withdrew.

Mr. D. Clay.

Mr. Daniel Clay (Sowerby Bridge) examined.

12,196. (*Chairman.*) You are a woollen manufacturer?—Yes.

12,197. Where are your works situated?—At Sowerby Bridge on the banks of the river Calder.

12,198. What number of men do you employ?—About 300 hands men, women, and children.

12,199. What weight of coal do you consume?—About 50 tons per week.

12,200. What weight of ash do you make?—We have never made that calculation, and I cannot tell you that.

12,201. What do you do with your ashes?—We take them over the river, and lay them up until they are wanted to be taken up for mending roads.

12,202. Do you throw any of them into the river?—No.

12,203. Have you any smoke-preventing apparatus?—No.

12,204. Have you heard the evidence which Mr. Rawson has given?—Yes.

12,205. Do you believe it?—I cannot doubt his word, but other persons experience difficulty; for instance, Mr. Ackroyd and Messrs. Crossley. I have heard a good deal about it, and I think that the difficulties may be overcome if there is a determination in the matter.

12,206. You will have to stand up to your fireman and make him acquiesce?—Yes. I believe that it can be done with an intelligent fireman.

12,207. Do you use much water?—A good deal.

12,208. Where do you get it from?—From some springs which we have in the yard, and others on the hill side. We have been so troubled with the river water, having had so many goods spoilt with it, that we were obliged to be at an expense of nearly 1,000*l.* to get pure water. We have this pure water for something like six months in the year, but during the remainder of the time we are obliged to take the river water, which is very bad in summer time. It is generally dirtier in summer than in winter.

12,209. How long have your works been situated where they are?—100 years.

12,210. You used the river water on your premises at the first?—Yes, at one time we did so.

HALIFAX.

Mr. D. Clay.

17 Nov. 1866.

12,211. And it has gradually been growing so much worse that now you cannot use it?—We cannot use it.

12,212. It has spoiled your goods?—Yes, to a great extent.

12,213. And it has done you serious damage?—Yes. We make white goods, and we have been sadly plagued with tar on the pieces.

12,214. Has the state of the water prevented you making those white goods?—No, because we have got another supply of clean water, but it has done us a great injury.

12,215. Is your water hard or soft?—Soft.

12,216. Do you dye at all?—Yes, a little.

12,217. What materials do you use in dyeing?—The same as other dyers—indigo, and logwood, and other dyes.

12,218. Do you know what amount of solid refuse you make?—No, it is not a large amount.

12,219. Does it pass into the river?—Yes.

12,220. You have not attempted to intercept it?—We have not.

12,221. Do you use much soap?—We use a pretty fair quantity of soap, but I cannot state how much.

12,222. Do you intercept the soapsuds, and get any of the soap back?—We sell them to Messrs. Teall, Le Paige, and Company, of Wakefield.

12,223. How much do they pay you?—About 150*l.* a year.

12,224. Do you know what weight or value of soap you use?—No.

12,225. But it must be a large quantity?—Yes.

12,226. Do you know what weight of wool you use?—I daresay that we use about 100 packs of wool every week. We are worsted spinners as well.

12,227. What accommodation have you for your workpeople? Have you privies or waterclosets?—Privies.

12,228. Where does the refuse go?—We have carts made for the purpose, and we cart it away on to land.

12,229. You do not put it into the river?—No.

12,230. Are there any works situated upon the river below you?—Yes.

12,231. A great many?—Yes.

12,232. You receive the pollution which comes down from above?—Yes.

12,233. And it annoys you in the river?—Yes. It has more particularly done so latterly. Our next neighbours above have just built a dye-house above us, and since they have built that dye-house the river water has been a great deal worse, in summer time particularly.

12,234. How far is their dye-house above you?—About a mile.

12,235. Then it would be a costly thing for them to send their dye water past your premises in a sewer or outfall?—They may pass it down in that way, but I do not know whether it would do for their purpose.

12,236. Do you use any of the dirty water for your steam purposes?—We use it for condensing purposes for the steam-engine.

12,237. Do you feed your boilers with it?—Yes.

12,238. We have had it in evidence that that dirty dye water is better in some instances for feeding the boiler than a bright spring water?—Our river is not so bad as it is at Halifax, it is cleaner.

12,239. What is generally the character of the refuse which comes from your works. You say that you dispose of the ashes and that you dispose of the soil from the people, and that the soap refuse is disposed of?—There is nothing but the dye-house water which is sent into the river.

12,240. Do you think that it would be difficult to retain the solids in the dye-house refuse before the cold water goes into the river?—I think that it would not be so very difficult. I have known it done. Our predecessors, I believe, did it. The refuse is run into a tank for the purpose of having it as manure for the land.

12,241. Then you would not be very much punished if you were told that you must not let the solids go in?—I think not, looking at what we make.

12,242. (*Mr. Harrison.*) Do you think that anything could be done in the way of purifying the dye water itself?—I do not see that it could. I could not say, after hearing the evidence, that it could be done.

12,243. What weight of solid dyewoods do you use in the course of a year?—We do not use very much dyewood. We use a good deal of indigo. We use very little of the wood.

12,244. Is the refuse diluted with water which is impregnated with indigo?—No; we do not turn the dye water into the tank. It is only from the cloth mill.

12,245. Do you think that you could precipitate the indigo from the dye water by any means?—No, I do not see how it could be separated.

12,246. If any simple means could be recommended for separating the colouring matter from the dye refuse water at a slight expense, without taking up much room, should you object to it?—No, I should very much like it to be done.

12,247. If all persons were obliged to do it do you think that you, as a dyer, would be benefited?—Yes, decidedly.

12,248. So that, although it might be an expense to you, you might get an advantage?—Yes; we should be compensated by having clean water.

The witness withdrew.

Mr. Richard Bracken (Luddenden) examined.

Mr. R. Bracken.

12,249. (*Mr. Harrison.*) You are a paper manufacturer, I believe, on the Luddenden Valley?—Yes.

12,250. Have you works near the junction of that brook with the Calder?—At a distance of about a mile and three-quarters.

12,251. Are there any manufactories situated above you?—There are some spinning mills above us.

12,252. But no dyeworks?—No.

12,253. Or any manufactories of any kind which pollute the water?—No.

12,254. Then you get the water to your works in a tolerably clear state?—Yes. Latterly we have had the water a little muddy in consequence of the carrying out of the waterworks.

12,255. That is only a temporary inconvenience?—Yes.

12,256. Do you use the water of the Luddenden Brook for paper making?—Yes; a good portion of our water comes from the brook, and we have some spring water which we economise and use when the other is dirty.

12,257. What character of paper do you make?—Brown paper. We make a little half-white paper. We do not make any white paper. We call it a brown mill.

12,258. Do you use any quantity of bleaching materials?—A little.

12,259. What is the refuse which you throw into the brook?—We do not throw in any refuse, except the dirty water which we have used for washing.

12,260. Do you add any alkali?—We use lime to boil with.

12,261. You boil the rags with lime and wash them?—Yes.

12,262. And all that wash water passes down into the brook?—It does.

12,263. Containing dirty lime water and some of the materials, I suppose, of the rags?—The fine portion of the fibre which is washed away.

12,264. What do you do with the solid lime?—The solid lime which does not go into the rags we take on to the land.

12,265. What other materials in the shape of chemicals do you use besides lime?—We use a little bleach and sulphuric acid.

12,266. Do you pass the bleach into the water after you have used it?—We do not wash out the bleach. We use chloride.

12,267. And of course it would be to your disadvantage if you let the chloride of lime pass away

HALIFAX.

Mr. R. Bracken.

17 Nov. 1866.

before you had got all the goodness out of it?—I do not know whether it would be economy or otherwise, but it is convenient to do so.

12,268. Do you use water power?—Yes, and steam.

12,269. What amount of power in each case?—I should think about 50-horse steam power and 40-horse water power. The water varies.

12,270. And you use steam to make up the deficiency?—Yes.

12,271. What weight of paper do you manufacture in the course of a year?—Between 600 and 700 tons.

12,272. Do you know what volume of water you use for cleansing that paper?—I have no idea.

12,273. What weight of coal do you use. That again depends upon the water supply?—Yes, about 1,700 tons.

12,274. Do you use any means for consuming the smoke?—None beyond careful firing.

12,275. Is that effectual?—Not very much so.

12,276. I think that after the lesson which you were taught by Mr. Rawson just now you will probably be looking about to establish some system of smoke prevention?—I am afraid that I have not Mr. Rawson's determination.

12,277. Do you use any Esparto grass?—No.

12,278. You use rags of rough quality, I presume; not white rags?—Just so.

12,279. What weight of lime do you use?—We use about 100 tons of lime in a year.

12,280. And how much bleaching material?—The quantity is very small. The bleach, I think, would not be more than three or four tons, and the sulphuric acid about the same.

12,281. What do you do with the ashes which you make?—We have had a good deal of trouble in disposing of them. We have buried them lately.

12,282. You do not turn them into the brook?—We have not done so for very many years. We did not throw a shovelful in yesterday, although we were very much tempted to do so.

12,283. Does the Luddenden Valley extend for some distance above you?—Yes.

12,284. Has it a considerable fall?—Considerable.

12,285. The quality of the water, I suppose, is much the same as that of the Hebble?—I should say so.

12,286. Is it open to any manufacturer in that valley to obtain a site, and to commence dyeing and other works?—Yes, I should say that it is.

12,287. Should a dyer locate himself above you and pollute the water how would it affect you?—It would affect me injuriously.

12,288. It would oblige you to find another source of water supply, or, I presume, to leave your premises?—The water is frequently fouled, and we have provided for ourselves a tolerable supply of water for washing purposes. We have constructed two reservoirs, one of about 19,000 feet and the other of about 12,000 feet.

12,289. So that you are comparatively independent?—Yes.

12,290. But you might be injuriously affected?—We might be injuriously affected.

The witness withdrew.

Mr. W. Morris.

Mr. William Morris (Sowerby Bridge) examined.

12,291. (*Mr. Harrison.*) I believe you are a manufacturer at Sowerby Bridge?—No; at a place a mile and a quarter from Sowerby Bridge, called Triangle.

12,292. You are also one of the Vice-Presidents of the Chamber of Commerce for the Halifax district?—Yes.

12,293. Are your works situated within the parish of Halifax?—Yes; immediately above those of Mr. Rawson, who has given evidence.

12,294. Not within the borough, but within the area supplied by the corporation with water?—No; it is beyond that.

12,295. What trade do you carry on?—Worsted spinning.

12,296. How many hands do you employ?—About 400.

12,297. Do you use water power or steam power?—Both water and steam power combined.

12,298. Is the water obtained from the corporation?—No; from the Ryburn, which is a tributary of the Calder.

12,299. What horse power or what steam power do you use?—Combined, about 50-horse; the water power is variable.

12,300. When you have a good supply of water, what is it?—The maximum is about 14-horse; the average power does not exceed 8-horse. We always use steam power.

12,301. Are there other mills above you on that stream?—Yes, several.

12,302. Do you find any inconvenience from their passing solid matters into the river so as to affect your water power?—I do, but only occasionally. I experienced a loss some few years ago, in consequence of the flood bringing down a great deal of débris against the shuttles, which, when drawn, went into the goit. As I attempted to turn, as usual, without being aware of the obstruction, the main gearing broke down, and I was put to a cost of 50*l*.

12,303. Had you no remedy against anyone above you?—That I do not say; it was a friend and neighbour.

12,304. Do you think it is desirable to have all solid matter kept out?—Most undoubtedly.

12,305. What weight of coal do you use?—About 1200 tons per annum.

12,306. Do you carry out any system of smoke consuming?—No, no more than giving instructions to the fireman to do all that he can, and by the admission of air to supply as much oxygen as he can without cooling the furnaces.

12,307. Did you hear Mr. Rawson's evidence?—No, but it is a question that has so often been discussed between us that I am quite aware of all that he could say.

12,308. Is it the fact that his chimney is free from smoke at Mill House?—I should think it is.

12,309. As far as smoke consumption goes, his system appears to be perfectly successful?—Yes.

12,310. Do you agree that if he can effect a saving of from 20 to 25 per cent. on the coal, it is desirable to carry out the same system?—Yes; but that is only a partial view of the question. I have never heard it confirmed by anyone that the saving of coal is anything equal to that. I live next to Mr. Rawson, and I am as anxious as he is for the suppression of smoke. My daily comfort is involved in it, and I am always inquiring upon the subject, and I can succinctly state the result of my inquiries.

12,311. Will you be kind enough to do so?—It will be necessarily very short. The prevention of smoke is highly desirable. It can be accomplished in a great degree in ordinary furnaces by the provision of more boiler room than is absolutely required for the economical raising of steam, if that extra boiler room is combined with judicious firing; or it can be accomplished by mechanical means, say by Jukes's patent, but only at a greater cost of repairs and stoppages. But even this system, to be worked advantageously, necessitates more boiler space to prevent combustion being forced. Under these conditions, I believe a diminished consumption of coal would be the result; and although all legislative restrictions upon trade are liable to result in evil, and ought to be avoided as much as possible, yet I think the public comfort may demand the compulsory limitation of smoke. The law, to be just, however, must be of universal application where practicable.

12,312. Did you hear Mr. Rawson say that he should be able to do away with one boiler altogether in consequence of adopting Jukes's system?—It is pain-

ful to give evidence in opposition to Mr. Rawson, because I know it is a darling subject with him; but I feel the great importance of this inquiry, upon which legislation may be based, and therefore all neighbourly feeling must sink, for if you go away from here with opinions expressed in an important town like Halifax, and legislation is based on those opinions, if they are erroneous, we should do a great wrong to you and the public. Messrs. Whitworth, of this town, who are enterprising and bold men, sparing no expense, but always with a view to frugal management, have put down, I believe, four boilers with Jukes's furnaces, and I have asked Mr. Whitworth three or four times, and he stated in answer to my last inquiry this week, that more boiler room is required for Jukes's furnaces, for they cannot otherwise get up the steam. The great evil of Jukes's furnaces is this; there is no doubt that they prevent smoke, but the boilers are liable to be burned away, and also the furnaces, even with the protection that one of Mr. Rawson's men has patented, are liable to be injured, and frequent stoppages may occur as the result. A gentleman, who shall be nameless, lately put a boiler up under circumstances to give it every opportunity of being worked out without regard to expense. Still he gives it as his opinion, that where there was only one boiler, it would be dangerous for them to rely on Jukes's invention; the stoppages being so frequent, and the flame so intense at the mouth of the furnace, there is a calcareous deposit on the boiler to which it is always liable, and they are liable to be burned out. I should say that stoppages are multiplied greatly from the use of Jukes's furnace as compared with ordinary boilers. Still I think if you could place all the country under one universal law, so that one manufacturer should have no great advantage over another, all might be obliged to provide sufficient boiler room. Jukes's invention would then be found to be very useful, accompanied with a saving of coal; but you must have a larger firing space; for instance, to refer to the Chairman's opinion as expressed during the inquiry at Bradford, he stated that he would undertake to fire without causing any smoke, and that the usual plan was to choke up the front of the fire; but the proper plan ought to be to push forward the incandescent coal, and to place the fresh live coal in front. The consequence of that would be, that you would cover a large part of the furnace, through which the air would not pass sufficiently for perfect combustion, and the upper surface would become caked by the action of the fire. You would then find it impossible to raise the amount of steam that the works would require.

12,313. (*Chairman.*) You are attempting to describe the effect of the mode of dealing with the fire which I recommended?—I am.

12,314. Then I can confidently state that it is as erroneous a description as could possibly be given. If a thing has once been done, do you believe it can be repeated?—Under similar circumstances I believe it could. I have anticipated that by saying that with a larger than ordinary surface of furnace it could be done, but if you want to increase your steam you could not do so. There is a tendency in all of us to go on increasing our business and to put on as much power as the engines or boilers can do, and if you start with an abundant supply of boiler room you will find yourself in a few years with a larger weight of work on the engine, in which case steam can only be raised by making the boilers do all they can. I still dissent from the opinion that you can raise the same amount of steam with firing as you propose in comparison with the plan I am speaking of.

12,315. It has been said that the State should not interfere with trades because trade will do what is necessary, and therefore it would not be a proper thing to say to manufacturers, Carry on your business as you like, but you shall not throw out dense volumes of smoke?—I think that it is quite competent for them to do so without governmental interference.

12,316. You would let the manufacturers do it in whatever manner they please?—Yes.

12,317. The State should not dictate the mode, but simply say, We believe that your trade can be carried on without black smoke, whether with more boiler space or with less we do not say, or whether with a saving of fuel or otherwise. Carry on your trade in the best manner that you can but you shall not pollute the atmosphere of the district with black smoke?—I think the public may claim that at the hands of the Legislature.

12,318. The rivers are filled with abomination in the way of sullage and fluid. Is it not the duty of the Government therefore to say, It has been proved to us that the manufactures of the country can be carried on without pouring into rivers solids, such as ashes and effete matter of human excrements, solid refuse from dyeing processes, such as spent woods, either chipped or rasped, and other solids. You as riparian owners for the future use any other means you like, but you shall not make the rivers of the country your scavengers?—In a manufacturing district the first purpose of streams is to aid manufacturing industry, and they may reasonably receive all liquid or soluble refuse from works connected therewith, for it is not often that it is injurious to health. Solid matter ought, however, rarely to be thrown in. Streams may also serve, in the absence of other provision, for the drainage of excremental and other refuse, if liquid or soluble, from dwelling houses, but when from the numbers of the population the healthfulness of the atmosphere is injured, then it ought to be compulsory to have subsiding reservoirs or tanks combined with a system of deodorizing, and, if practicable, from local conditions, of utilizing the sewage.

12,319. If you can prohibit the discharge of effete refuse from a town surely you can do so in the case of one individual or one house. You say that certain solids may go in, but cannot you see your way to the prohibition of solids of all kinds?—Yes, very nearly. Without being too doctrinal and positive I think that all solids might be prohibited, but the reason why I draw a distinction between a unit and numbers is this, that where you have a number you can go to the expense of collecting and diverting the sewage, which you could not do in individual cases. In Triangle there is no other mode for any refuse, liquid or soluble, passing away from that village except by its natural drainage down to the river.

12,320. If you beg the question so far as that the legislature might as well put down its hands and say nothing could be done?—How am I begging the question?

12,321. You say that the village is in such a position as that the effete matter from it cannot be prevented from going into the river. There is an invention which has been recently introduced called the dry earth closet, and by that pollution of the river might be prevented. At Wakefield they are putting the invention to the severest test; they are using these earth closets in the cells of the prison. Therefore it might be said to the owners of property in your village, or to the residents there, you shall not pass your effete sewage matter into the river, you may use earth closets, it will be a much cleaner and sweeter system for you, and you will have the advantage of retaining the refuse. If you have a garden you may use it there; if not, it can be taken away and deposited elsewhere so as not to be offensive?—That system might do for small cottages, but I cannot conceive it possible that in the ordinary dwellings of this country such a process could be conducted daily and weekly.

12,322. You can conceive that if a dwelling house has its drain connected with the nearest watercourse or river, and there are persons below inconvenienced by that drain, you would have a right to say to the person occupying that dwelling, You shall not inflict any inconvenience upon the persons below you, and at whatever cost or labour to yourselves you shall resort to some other method, either a common privy or an earth closet?—A common privy would be a remedy worse than the disease; miasma would always arise from it.

HALIFAX.

Mr. W. Morris.

17 Nov. 1866.

12,323. But by the use of an earth closet the difficulty could be got over with a little additional manual labour?—My waterclosets drain down into my dam, and therefore I do no harm, but still I coincide with you to this extent, I say that towns with a large population might be subjected to compulsory regulations, such regulations to be put in force by inspectors appointed by corporations or boards of healths, but with a power for a given number of inhabitants, say 12, in case of any neglect on the part of an inspector, to enforce the application of the laws by appeal to a county or governmental authority. We are not at issue on these main points, and I agree with you generally. It is not only excrementitious matter but all the nasty filthy stuff which cottages have that ought to be kept out of the river. You are aware that by the Common Turnpike Road Acts, at every 20 yards or some other given space, there must be openings made for drainage from a common high road, showing that the law contemplates there must be some passage to that main arterial drainage. The whole thing is bound up in one great system; you cannot ask a cottager to have a large reservoir in which to collect the water, his refuse must follow the natural course of drainage. I think it is highly desirable that where the atmosphere is likely to be polluted, some great system should be adopted. Above us at Ripponden if they are building a cottage they cart on to the bridge the soil they remove from the foundations and they pour it into the river, and so it comes into my dam.

12,324. Do you not think that that should be prevented?—Undoubtedly.

12,325. Supposing that you took proceedings against them now what would be the result?—There would be very great difficulty in getting evidence as to the fact, and much expense also.

12,326. Have you formed any opinion, if any legislative enactment is to be passed, what form the conservancy of the river areas of the country should take?—No, not beyond what I have previously expressed.

12,327. (*Mr. Harrison.*) Did you read over the evidence that was given by Mr. Ripley at Bradford?—Yes.

12,328. You are a Vice-President of the Chamber of Commerce in this district?—Yes.

12,329. Did you observe the figures which he gave as to the weight of wool manufactured in this neighbourhood?—Yes, I did; I know also the parties who assisted in preparing those figures, and I have the fullest confidence in their intelligence and integrity.

12,330. Do you believe that we can depend upon them as being as accurate returns as any that can be made?—Yes.

The witness withdrew.

T. Shaw, Esq.

THOMAS SHAW, Esq., (Halifax) examined.

12,331. (*Chairman.*) You are Mayor of the borough?—Yes.

12,332. What business do you carry on?—The worsted and woollen trade.

12,333. Where is your mill situated?—In Stainland on a branch of the Calder.

12,334. What number of hands do you employ?—About 2,000.

12,335. What weight of wool do you deal with per annum?—We use about 350 packs per week.

12,336. What volume of water do you use?—About 600,000 gallons a day for condensing, dyeing, and cleansing goods and wool washing; about 200,000 gallons for condensing, 50,000 gallons for dyeing purposes, which become very dirty, and about 250,000 gallons for cleansing the goods after being dyed, but that does not become very dirty, and 100,000 gallons for wool washing with soap.

12,337. What weight of soap do you use per annum?—About 700 packs a year.

12,338. About what quantity of oil?—I cannot state.

12,339. Do you use any chemical ingredients, such as acids?—Yes, for dyeing.

12,340. Do you use sulphuric acid?—Yes, we use about 140 tons of acid liquor per year.

12,341. For dyeing purposes?—Yes.

12,342. Do you use any lime?—Very little.

12,343. Any dyewoods?—Yes, but not many, generally rasped logwoods.

12,344. What weight of them do you use?—In dye wares altogether we use about 200 tons per annum, of indigo about 50 chests.

12,345. What weight of coal do you use in a year?—About 6,000 tons.

12,346. Do you know what amount of ashes they produce?—About 10 per cent.

12,347. Are you a smoke maker or a smoke preventer?—Our engineer professes to be a smoke preventer; we do consume it.

12,348. Do you use Jukes's patent?—Yes.

12,349. Like Mr. Rawson?—Yes.

12,350. Can you state how long you have used this means of preventing smoke?—We have not got Jukes's patent throughout the establishment; our man has a patent, or professes to have, but he does prevent the smoke by some arrangement of his own.

12,351. Does it save fuel in your case?—I cannot say that it does, but it prevents the smoke, and that is what is required.

12,352. What do you do with the ashes?—We have many bye roads that we have to repair, and we put the ashes on them.

12,353. Do any of the ashes go into the river?—None.

12,354. Do you use any water from the river?—Yes.

12,355. For what purpose?—For general purposes. We get water from wells and springs, on our own premises, as well as from the brook.

12,356. Do you get any from the corporation waterworks?—No.

12,357. Do you know what quantity you obtain from the wells?—About 100,000 gallons a day; we have a bore-hole of about 600 feet deep.

12,358. How near does the water rise to the surface?—Within perhaps five yards.

12,359. Does it vary during the year?—No, we do not find that it varies.

12,360. Do you throw any waste refuse matter into any brook or stream?—We throw in what rasped wood we use.

12,361. That goes in with the waste dye water?—Yes.

12,362. Do you do anything with the soapsuds?—No; we did so, but we have been building over where we had a convenience for that purpose, and we are making further convenience to extract the grease.

12,363. At the present time the grease goes into the river?—Yes.

12,364. The rasped wood goes into the river?—Yes; the chipped wood we burn.

12,365. (*Mr. Harrison.*) Could not the rasped wood be prevented from going into the river?—Perhaps it might.

12,366. What privy accommodation have you on your premises?—They are all privies; we have them in coaches, and we take the sewage on to the land after they are filled.

12,367. You do not pollute the river with it?—No.

12,368. Is the stream worse now than it was when you first knew it?—Yes.

12,369. Are there any mills above you?—Yes.

12,370. Do any of them send their ashes down the stream?—No.

12,371. Have you any water power?—No, we had, but it is done away with.

12,372. Is the bed of the stream rising opposite to your works?—No, I do not suppose that it is; it is only a small rivulet.

12,373. Were you at all inconvenienced by the flood of last night?—No.

12,374. Is there any agricultural land close to your fields?—Yes.

12,375. Would it be convenient to put the dye refuse on to any portion of that surface to irrigate it?—I do not know; we might do it, but I do not see that it would be any benefit to the land.

12,376. Why did you abandon the water power?—Because we did not find it advantageous, it was only a small power, abount 16 or 18 horse, and we lost work by it; we found that in using steam power we could produce far more weight of goods than what would compensate for the amount of coal.

12,377. Therefore you did not abandon the water power because there was any obstruction in the river, but because it was uncertain?—Yes, we could not get the weight of material out by its use.

12,378. Does the river now contain as large a volume of water in dry weather as it used to do when you first knew it?—I do not suppose that it does.

12,379. How has it been reduced in volume?—I think the land drainage runs the water out quicker.

12,380. Are there any reservoirs at the head of your stream?—Only our own.

12,381. Have you a reservoir?—Yes, two.

12,382. What area do they cover?—I cannot say.

12,383. Where does the mud go to when you cleanse them?—Down the river.

12,384. If any regulations were laid down as to the purification of the river, and a clause prohibited mud to be flushed into the river, you would have to find some other mode of getting rid of it?—Yes.

12,385. Do you see any other mode of doing it?—The mud comes from the bottom, and perhaps we should abstain from flushing it out if others did the same.

12,386. Proprietors of mills above you do the same as you do; they flush their mud out and you suffer from it?—Yes.

12,387. Do you ever shut down your shuttles to prevent it coming in?—Yes.

12,388. Then the people below you, if there are any, would have to put their shuttles down when you sent your mud out?—Certainly.

12,389. Do you use Jukes's boilers?—Yes, one.

12,390. How long have you had it?—Some two or three years.

12,391. Does it answer?—I cannot say that it does; we have it in one of our separate mills; we have only one boiler connected with it, and we frequently have stoppages for a week in making repairs, in altering and repairing parts, more particularly the plates of the boiler, for if you are not very particular with the water that is supplied to the boiler, and any sediment gets to the bottom of the boiler, the powerful heat that Jukes's invention sends out burns out a plate, and then a new plate is required.

12,392. You are not quite so warm in favour of this invention as Mr. Rawson was?—No, not at all; the only question is this, supposing that instead of one boiler there were six, they might answer, because there would be plenty of boiler room, but I do not agree with him in saying that they can do with fewer boilers.

12,393. Have you much difficulty with your boiler from the effect of the water?—I do not suppose there is much.

12,394. Some of the water that is used in this neighbourhood we have heard causes no deposit, is it possible that Jukes's patent might be unsuccessful in one case where incrustation was liable to take place, but might be successful in another where the water produced no incrustation?—Certainly, but it is very difficult to get the kind of water which causes no incrustation.

12,395. (*Chairman.*) Some of the water from the dyeworks that has got grease and acids in it proves to be the best for boiler purposes, because it never forms any incrustation?—Yes, but the misfortune of Jukes's patent is that the fire is underneath the boiler; if you have the fire-boxes near to the boilers you do away with any sediment.

12,396. Jukes's patent makes it necessary to have cylindrical boilers with the furnace underneath?—Yes.

12,397. The process is not applied to an internal furnace?—No, they cannot apply it, I believe.

12,398. Have any of your boilers internal furnaces?—Yes.

12,399. Are they Galloway's, with tubes passing through the flues?—Yes, conical tubes.

12,400. There are two furnaces in one boiler, and by firing the two alternately you prevent smoke?—Yes; we have the door perforated as well, and when they are fired the fireman shuts the perforated door, and lets a little atmospheric air in; it passes in during the first flush.

12,401. And in that way smoke is prevented?—Yes.

12,402. (*Mr. Harrison.*) Are you satisfied in the first place that smoke can be prevented?—Yes.

12,403. Are you also satisfied that it can be prevented without the manufacturer sustaining any decided loss?—Of course it depends upon capital, because supposing that a man could only afford to put down one boiler with a steam-engine, I should not advise the application of Jukes's patent to that; if there were two boilers it would be all right.

12,404. (*Chairman.*) Can you use steam power and not produce a dense volume of smoke?—Yes.

12,405. Either with one boiler, or with any number of boilers?—Yes.

12,406. Do you think it would be injurious to any class of trade if the legislature made it imperative that all boilers should be so used as not to produce smoke?—No, I do not suppose it would; as far as I can judge it would not.

12,407. Leaving the means of doing it to the individuals, but saying, smoke shall not be sent up your chimneys?—I think it can be done.

12,408. Do you think it possible for a person earning 100*l.* a year, by carelessly working his chimney to destroy property worth many thousands a year by throwing out dense volumes of foul smoke into the atmosphere?—Supposing that a man puts boilers down and pours out a dense volume of smoke from his chimney, and goes on uncontrolled, he may injure other people's goods to an extent far greater than I can pretend to say.

12,409. Supposing it could be proved that he could carry on his business without making that smoke, should you think that he ought to be compelled to do so?—I should say so.

12,410. You think that the law ought to say, you shall not do it?—Yes.

12,411. (*Mr. Harrison.*) With regard to dye water, you heard, I believe, what Colonel Akroyd said yesterday about filtering; have you ever tried any experiment of that kind?—No.

12,412. If he is correct in his views, do you think there would be any hardship in enforcing such a system as he spoke of, I mean a system of using lime as a precipitate in a compact filter?—If it could be done we should be glad to do it.

The witness withdrew.

WILLIAM ALEXANDER, Esq., M.D., M.R.C.P., (Halifax), examined.

W. Alexander, Esq., M.D., M.R.C.P.

12,413. (*Chairman.*) I believe you have certain information which you wish to lay before the Commission?—Yes.

12,414. Have you formed any opinion as to the physical character of this district?—I have. I am the author of a paper on the geology of the parish of Halifax, and that necessarily involved its physical character.

12,415. What is the character of its geology?—As a mountainous region it is variously elevated from 400

HALIFAX.

W. Alexander, Esq., M.D., M.R.C.P.

17 Nov. 1866.

feet to 900 feet above the level of the sea; the inclination of the plane varying from 1 to 4 inches in a yard, its general drainage is towards the Calder, and its declivity with an inclination to the west and south, from the summit of the moorland. The stratification of the district is that of the millstone grit, and this town, standing upon the middle member of that series, the upper soil is of a light peaty character, a non-retentive soil, which will hold but 25 pounds of water per so many cubic feet, whilst at Leeds and Sheffield the same area of soil would hold 60 pounds of water.

12,416. Would you not infer from that that you would have a dryer atmosphere here?—Usually so; nevertheless it varies a good deal; the mean annual temperature is 48·5, with a rainfall of 240 days amounting to about 34 inches; the aqueous vapour averages one per cent., or about three grains of water in a cubic foot of atmosphere.

12,417. How long have you known this district?—I have known it all my life as a native, and for 25 years as physician to the public hospital.

12,418. Have you made any estimate showing the progressive increase of population?—I have but little to add to what has already been stated by the town clerk and the ex-mayor, but I may observe that this town doubles its population in about 28 years; the parish takes 44 years in accomplishing the same purpose.

12,419. Have you collected any statistics as to the local mortality, or can you state anything as to the character of the local diseases?—I have had upwards of 70,000 of the labouring poor under my charge, and therefore I have had ample opportunity for observing these particular points. I quite concur with the ex-mayor in much that he has stated. I could perhaps a little better than he describe the haunts of disease and the localities in which it is most frequent, and describe something of the districts bordering upon the lower levels, and the outfalls of the drainage as to which perhaps this Commission would wish for some information. The Public Health Act was granted upon my petition.

12,420. Are there certain parts of the town where the mortality is much larger than in others?—Very much so; the greater the density of the population *cæteris paribus* the greater the amount of sickness and mortality.

12,421. Is that necessarily so?—I think it is necessarily so; the fouler the atmosphere the lower the standard of health of the population.

12,422. In what localities in Halifax should you say there was the greatest amount of disease?—The Old Bank is one, and others which I trace on the map; Charlestown is an unhealthy district.

12,423. What are the types of disease which prevail in those districts?—These districts are chiefly occupied by the humbler and more destitute class of the population, and as such there is no doubt that their habits and want of cleanliness, and the want of suitable and properly cooked provisions expose them to disease; there are a variety of causes that will greatly modify the influence of such diseases and their results, and I estimate that for one death there will be usually about 10 attacks of illness.

12,424. Do they suffer from typhus fever and typhoid fever?—Not generally. I may observe that with regard to typhus we have not above five per cent. of the gross mortality who die of that disease. The deaths from consumption are one in eight of the population, whilst old age carries off one in ten.

12,425. Is there occasionally typhus and typhoid fever among the poor?—Yes,; but less so than formerly in Halifax.

12,426. Do you know of your own knowledge the condition of the patients in Wakefield gaol?—Not very well, although I know the officials there, the resident surgeons.

12,427. If typhus fever can be banished from the gaol at Wakefield, is it practicable in your opinion to banish typhus fever from the cottages of the poor?—I have always thought it highly probable.

12,428. If you could give the poor more space for air and persuade them to have better ventilation, improve their moral habits, and make them more careful as to clothing and living, do you think they might get rid of typhus fever?—Yes; epidemics would, by such means, be very materially modified, and rendered more harmless; when they did appear they would present a less grave type.

12,429. Is typhus fever a disease very fatal to adults?—Yes; I think it is more so than to children.

12,430. Is it not more fatal to adults between the ages of 20 and 40?—Yes, it is not confined to them at all, but it is more fatal. It is not however our scourge, for pulmonary consumption and affections of the respiratory organs are the prevailing diseases here.

12,431. What do you think generates those diseases?—Partly the climate; it is partly constitutional taint in the case of consumption.

12,432. And perhaps the nature of the occupation?—Yes, frequently.

12,433. From living in confined rooms?—Yes, and dusty departments; a fatal trade here is that of the stonemasons and quarry men.

12,434. In consequence of inhaling stone dust?—From inhaling stone dust and gritty particles which fly off from their chisels.

12,435. I believe they are not a very sober race?—No, the quarry men are not; the stonemasons are more temperate.

12,436. Have you made any chemical analysis of the water in the Hebble Brook?—Yes, from time to time, when I had leisure to devote to the sanitary question upon which I gave some courses of lectures some years ago, I then made three or four chemical analyses of the water of the Hebble Brook.

12,437. Have you any of the analyses here?—No.

12,438. Do you remember them?—Yes; there are some in Mr. Ranger's report. I can tell you that the foreign bodies found in the water consist of sulphuretted hydrogen, sulphates, soda, pearl-ash, ammonia, traces of green copperas, a great deal of organic matter, and in summer time infusoria and insect life, such as are found in stagnant pools. In times of flush of course the quality of the water differs, and then you would require to take three or four samples, the chief part of which would still be impure.

12,439. Do you find that infusoria will generate in water although containing a certain amount of chemical matter?—Yes, they can be detected by the microscope.

12,440. There is a considerable amount of lime and sulphuric acid, the products of dyeworks, and other ingredients passed into the stream, and yet you say that the infusoria generate and live in this water?—Yes; they are found there.

12,441. The ova are generated there?—Yes, and then if you consider that this occurs in a stream constantly flowing there, there must be a large dilution. If 30 tons a day of minerals are thrown in from the dyeworks, there would be a large dilution before those acids reach the place from which I took the specimen.

12,442. Is there anything further that you wish to add to your evidence?—I know all the tributaries of the Calder, and every foot of ground as a native of the place; I knew them as a boy, and from traversing every one of the 20 townships which constitute our parish in the course of business, I have got to know almost every part of the district; and I may say that the health of the people generally along those tributaries is often undermined. A residence along a watercourse in my opinion is undesirable in almost any case, but it must be still more undesirable when those streams are filled with organic matter and excrementitious deposits; and although the exhalation does not actually kill the inhabitants on the confines of the streams, yet their health is undermined; they live, but they are not in vigorous and robust health, and they become easy victims when seized with a malignant disease, such as

epidemics among infants; and erysipelatous infections and blood diseases, especially the adult population.

12,443. (*Chairman.*) If the wealth of a country is embodied in the health and strength of the inhabitants of that country, any legislation which tends to preserve health, and to prolong life, would cæteris paribus add to the wealth of the country?—Yes; it is a great relief to the rates and to the families whose heads would otherwise be called prematurely to their final rest.

12,444. Then if we legislated for purely selfish purposes, we should do the best possible thing by improving the health of the country, setting aside other and higher motives?—Unquestionably.

12,445. As selfish men we should be doing the best possible thing if we did all that was possible to improve the health of the working classes and to preserve that health to the longest period?—Decidedly so.

12,446. You find that more settled strength represents wealth, and that if you turn the country into barrenness by pollutions, such as are going on, property will revert to its original condition, when without inhabitants it had no value?—Yes.

12,447. (*Mr. Harrison.*) I take it for granted that you look with satisfaction upon the corporation waterworks, supplying the requisite quantity of water to the mills which are growing upon the hills of Halifax rather than in the valleys?—I do.

12,448. Enabling the population to be more scattered, and the labouring classes to reside in a more healthful position?—Yes.

12,449. Have you had any opportunity of analysing the Hebble water since Mr. Ranger's report, which is of some years standing?—That was, I think, in 1851. I have occasionally tested the Hebble water with litmus and turmeric paper, but I have not gone through a chemical analysis.

12,450. Would the analysis in Mr. Ranger's report in 1848 represent the present Hebble water?—Yes, with the condition that the water will differ according to the freshets and the floods. I recommended that beck to be tunnelled 20 years ago as the best thing which could be done, seeing that it was to be our main sewer. I recommended the tunnelling of it from Lee Bridge to Salter Hebble. It would then have been out of sight, and I thought that the reclaimed land would have paid the expense of the work. The stench along the banks of the Hebble from Salter Hebble to Clark bridge in a north wind is horrible.

12,451. The mayor and the town clerk have informed us that there are 960 waterclosets, but that there are a great number of ashpits and privies in the borough of Halifax. From your experience would you at all attribute the ill health of the poor to those ashpits, as well as to the cramped condition of the buildings?—In many instances the ashpit is too palpable. It is just at the entrance of their doors. The inmates are laid on their backs. This is one source which has certainly undermined health, if it does not produce a particular and special disease.

12,452. Then you think that ashpits, as well as cesspools, under and adjoining dwellings are sources of ill health?—No doubt of it, in those crowded localities where exhalations come into the windows of houses and penetrate the doors. I am bound to say that Mr. Magson, the inspector of nuisances, is most exemplary in his duties, and I am not aware of anything like such bad exhalations as used to be the case in years gone by.

12,453. Notwithstanding that care and attention on the part of the corporation, do you still attribute ill health to the presence of these ashpits?—I do in part.

12,454. Would you recommend that waterclosets, or some other means, should be substituted for ashpits?—Yes, where manageable, and good tubular drainage. But the 960 waterclosets referred to by the town clerk are principally in the houses of the better classes of occupiers whilst the poor people must join in a large pit which is constantly either overflowing or giving off exhalations and malarious gases.

12,455. When these ashpits have been placed at some distance from the residence, have you found them a source of ill health?—In some cases the vapours get greatly diluted, and I do not know that in the case to which Colonel Sibthorp used to refer there is any formidable objection. I mean the case of a privy of the ordinary kind in a garden at a distance from the dwelling with ordinary and due care being taken as to the removal of the refuse.

The witness withdrew.

Mr. Samuel Magson (Halifax) examined.

12,456. (*Chairman.*) You are the sanitary inspector of the borough of Halifax?—I am.

12,457. How long have you held the office?—About 15 years.

12,458. Have you any assistance in that office?—I have now a foreman over the scavengers, and an assistant.

12,459. How many scavengers have you under your charge?—Twenty-three.

12,460. How many ashpits have you to deal with in the borough?—The whole of the ashpits are not under our care, but only that portion of them for which the parties think fit to come forward and pay, but there is a loss upon what they pay.

12,461. In cleansing those ashpits do you cause a nuisance in the way of smell?—Yes.

12,462. Do the people ever complain of that nuisance?—They do.

12,463. Have you ever known fever cases in the houses bordering upon and near to those ashpits?—Yes. I have known cases of fever, particularly in confined streets or courts.

12,464. Do you know any of the parish medical officers?—Yes.

12,465. Do you know the relieving officer?—I do.

12,466. Do you ever see him in those bad districts where those ashpits are the worst?—I have sometimes seen him going about visiting the people who receive relief in those districts.

12,467. If fever prevails in the town where does it generally prevail?—The upper portion of Halifax is more subject to it than the lower portion.

12,468. Has it always been so since you have known the town?—It appears to be regularly so.

12,469. How do you account for that?—For instance, we have a portion of the town called Mount Pleasant, and the system of drainage had not been thoroughly carried out there. That, I think, is one reason, and another reason is that Mount Pleasant stands high, and just catches the wind from the north-east, while the lower portions of the town seem to be protected from the east wind by Beacon Hill. From my observation those are the causes. In fact, in going through the death rate with the registrar one day we found that even death is more prevalent in the upper portion of the town than in the lower.

12,470. What are the deaths principally from? Are they from fever, or from consumption, or from what?—The registrar does not return the names of the disorders.

12,471. Is any portion of the Hebble water used for irrigation?—From the end of the river Hebble water is taken on to property belonging to Mr. Akroyd, the gentleman who gave evidence here.

12,472. And used for irrigation?—Yes.

12,473. For ordinary grass land?—Yes.

12,474. Is the process productive?—Yes, so the farmers have told me.

12,475. Have you had any report of its causing fever?—I never heard of it until Mr. Akroyd mentioned it in his evidence.

12,476. No person has complained to you about it?—It is out of my district.

12,477. You never heard of it until now?—No.

12,478. What are the first works upon the stream?—Mr. Shaw Slater's works, where a liquor is extracted from wood. There is a goit, and they appear to throw the refuse down the goit.

HALIFAX.

Mr. S. Magson.

17 Nov. 1866.

12,479. And the refuse passes down the stream?—Yes, and it will get on to the land because they irrigate from the goit.

12,480. Are any privies and ashpits so situated that the refuse shall fall into the stream?—Yes, many; they begin at Salter Hebble; there are two privies and an ashpit so constructed that the refuse slides down into the stream.

12,481. Have you any power to interfere with that as a nuisance?—No; we have some similar ones in the borough; we brought the matter before the committee, and the owners seem to have intimated their right to do as they please; they have done it for a long time, and they do the best they can by covering it with flag; but they always say, "You throw the refuse of your "waterclosets into the stream, and we do no more."

12,482. Do any parties whom you know pass their ashes into the stream?—The cottagers do so all along the stream; some of the houses are so contiguous that they put up the sash, and throw the ashes out into the water.

12,483. So far as you know do any manufacturers do so?—I do not know any who do it now, but I have been during the present week up and down the whole of the streams, and there are ashes which look very suspicious on the bank; they are placed very conveniently for going into the stream.

12,484. Some of them might accidentally get in?—I am inclined to think that they get in when we are in bed. I have been very minute in the examination; they do it very cunningly and there are no traces of the ashes.

12,485. (*Mr. Harrison.*) Excepting in the bed of the river?—Exactly.

12,486. (*Chairman.*) What is lower Siddle Hall?—The sewage of the cottages there comes down the river.

12,487. And there are some chemical works, the refuse of which goes into the water?—Yes, the waste drain empties into the Hebble.

12,488. Then there are privies which empty into the stream?—Yes.

12,489. There are small gasworks, does any refuse from them go in?—I questioned the fireman and he says that they sell it. On inquiry at most of the gasworks I find that there is such an anxiety for the liquor and tar, that there is no occasion to throw it into the stream.

12,490. The refuse of the lower Shaw Hill mill goes in?—Yes.

12,491. Are any ashes thrown in there?—Yes; cottage ashes.

12,492. Is there any other refuse?—There is the refuse of a grease extracting work there, and within a day or two for the first time I have had a complaint about a most noxious smell at those grease works, and from my experience at other grease works, I think that the man is not thoroughly acquainted with the mode of doing it. Some years ago we had complaints respecting several firms, and they put their heads to work in order to carry on their trade without causing smells, and of late we have had no complaint about them.

12,493. You have a drain near Whitegate which passes into the brook?—Yes.

12,494. And there are two privies at Taylor's Bridge?—Yes.

12,495. Refuse liquid from some other works goes in?—Yes.

12,496. The main outfall empties itself into the brook?—Yes.

12,497. The drainage from the Caddifield district enters the brook?—Yes, there is a small district.

12,498. Then there is refuse from chemical works?—Yes.

12,499. And from works near the "Ship Inn?"—Yes.

12,500. There is refuse from Messrs. Whitehead's wire mill?—Yes.

12,501. And from the Albion Mills belonging to Messrs. Robert Crossley?—Yes.

12,502. There are two privies there?—Yes.

12,503. Then there is the refuse from the works of Messrs. Thomas Crossley and Company?—Yes.

12,504. I suppose that this list which you have handed in is a correct list of the class of refuse which goes into your river and brook?—Yes, with some qualification. As regards one or two gasworks which are named, I find upon strict inquiry that they are disposing of all their liquor and gas tar, but still there is evidence that it has gone in.

12,505. Within a recent period?—The tar is there in some places.

12,506. And I daresay that you have had complaints from manufacturers that their cloth is seriously injured if refuse tar gets on?—Yes, frequently.

12,507. Do you know anything of the mills beyond your borough?—Yes.

12,508. Do any manufacturers outside the borough throw in their waste refuse?—The ashes up in that neighbourhood are in a suspicious condition.

12,509. You mean suspiciously near the stream?—Yes; but I must also say that when we get above Pillings' dyeworks at Lee Bridge, the water is comparatively pure; and also above the works of John Crossley and Sons in Old Lane the stream seems to be pretty pure.

12,510. Do you think, so far as you know the district, that there would be any serious difficulty in all parties being compelled to keep their refuse out of the stream?—I do not; particularly the solids.

12,511. As to the fluid refuse, that is a question upon which you would not offer any opinion?—No, I am not enough of a chemist.

12,512. As regards solids, such as ashes and even privy refuse, if a large mill can keep out all its refuse, a small cottage may do so?—Yes; I think that it is decidedly necessary that some law should be enacted, or that there should be some supervision of greater force than we have, to stop all those solid matters from going into the stream.

12,513. Do any chimneys in Halifax smoke?—Very much so, many of them.

12,514. Do you think that if you were authorized to look after those chimnies, and if the law was powerful enough, you could induce the proprietors of them to prevent those chimnies from smoking?—I make regular inspections at intervals and report to the sanitary committee upon them. I have heard the evidence of Mr. Rawson given this afternoon, and I quite concur in his views relative to the application of Jukes's patent in this neighbourhood, for this reason, Messrs. Crossley have a chimney which has no other boiler than Jukes's patent, and I can observe that chimney for hours together and not see smoke come out of it; now and then, when I have made observations, there has been perhaps for half a minute of time a light smoke, but I have put it down, more to show the difference which I have observed than to indicate any quantity which has come out (*the witness produced a diagram and explained it*).

12,515. You think that trade might be carried on by well-adapted and simple means without making smoke?—I do, and perhaps it would not be unwise to add that Mr. Bailey, who was lately engineer to Messrs. Crossley's great carpet works, was decidedly opposed to Jukes's process, not on the ground that it did not consume the smoke, but on the ground that it was more expensive; but just previously to leaving he told me that they had arrived at a point at which it was rather a saving than otherwise; he has since left their employ and gone into business for himself.

12,516. Then your experience would lead you to the conclusion that that apparatus may be worked so as to prevent smoke, and at all events not to be more costly than the ordinary process?—Yes, that is from the evidence of practical persons; I have not tried it myself.

12,517. But you have watched the chimney tops?—Yes.

12,518. Do you know Messrs. Rawson's works?—Yes.

12,519. They do not make any smoke?—No; I have also observed Messrs. Edwards' works and also

the works of the late Colonel Polland in Wheatley. I went down to Wheatley and had some conversation with the engineer there, Mr. Law, who has the management of the work, and I asked him whether he would like to go back to the old process? "No," he said, "I am a gentleman compared with what I "used to be, and I am certain that we produce more "power with less coal than we did before." Relative to the other mode of firing, some 12 months ago Messrs. Crossley were very much complained of to the committee by myself in my reports and they seemed to be at a loss what to with their firers, the idea struck me one day that to try the men I would let them know as a secret through another person that I was going to observe, he went and did so, and on that day from that chimney for an hour and a half I could not see a streak of dense smoke, it was fired merely by hand.

12,520. But they knew that you were watching?—Yes, because I had sent somebody to tell them so. The result of it was that the ex-mayor and myself were deputed to go and see the principals upon the subject, and Dr. Wightman explained to Mr. Joseph, who has that department in hand, what we had done, and he went with us to the firemen. The man who was there said, "I can do nothing with these firers, "and I must have an entirely new set of firers to do "what you want." I said, "Perhaps these men will "do it if they have encouragement to do it," and Mr. Joseph said, "I like that idea, and so long as they "keep the volume of smoke down below what the "corporation allow, I will give them 1*s.* more a "week, and if they get above it I will deduct 6*d.*" Since then that chimney has not made half the smoke which it made before, and I inquired the other day, and I believe that the men are still in the receipt of their 1*s.* a week, and that is a great improvement (I think it justice to state that) upon the old mode of firing.

12,521. Then you think that it is quite as much a question of the fireman as of any special arrangement?—I would not go quite so far as that. I believe that Jukes's process is better for this reason, as Mr. Rawson has said, namely, that you have not to depend upon the fireman. In this part of the country, where there are little manufacturers, the engine tenter has to oil and look to the shafting, and so on, and in that case Jukes's process would still be doing its work, whereas without it when he goes away he is obliged to throw on a great quantity of coal, and, as you have explained to-day, that is a great cause of smoke, and then he goes and stirs up of the coal and there is a big volume of smoke. I think that Jukes's is the preferable plan. I may also state that I was deputed some time ago by Mr. Alderman Battison to go to the great paper works of Messrs. Wrigley, near Bury. We had heard of a great improvement introduced there, viz., hollow grate bars admitting air in front, and letting it out behind, just under the bridge. Before going near their works, we made observation upon two large chimnies of some 60 or 80 yards, and the result was very satisfactory, considering the amount of power which they had; it was nothing like so bad as in some places. When we got to the establishment of Messrs. Wrigley we found that they had 12 forty-horse boilers working night and day. They took us through the works and showed us the apparatus, and they seemed very much satisfied with Biggs's patent of hollow grate bars, but Mr. Alderman Battison and myself were of opinion that nothing was equal to Jukes's patent.

12,522. Have you not heard that Jukes's patent can only be applied to a circular boiler with the fire underneath?—Yes.

12,523. And that the modern process places the fire within the boiler?—Yes, I am quite aware of that. I am now speaking of smoke consuming and not as to saving fuel or heat.

12,524. You know what parliamentary smoke is?—Yes.

12,525. It is smoke which you can see through?—Yes.

12,526. Have you anything further to add?—I think that in all towns, particularly those which are situated as Halifax is, independently of sewerage, the bed of the river ought to be paved.

12,527. As they have been doing in Bolton and Blackburn?—I was not aware of that; I have stated that people living near the stream do not appear to suffer so much, but I think that is in consequence of the effluvium rising and getting to the upper parts of the town, and that persons on the immediate stream do not suffer. There is another thing which I should wish to add, namely, that I believe that if it was not for the chemicals of the dyers going into the drainage we should have a great deal more disease.

12,528. You think that the chemicals act as disinfectants and prevent the sewage matter from being more noxious than it otherwise would be?—I do. There is another thing, namely, that where there are no proper means of purifying sewage I think that privies are far preferable, and I think that earth closets (which I have not seen) would be far preferable to any watercloset system, unless there was some system of purifying the sewage before it went into the river. We find that in Halifax we have a very great difficulty in the old ashpit system, and no doubt there is a great deal of disease generated from our rude mode of carrying on ashpits and privies. Of late years, with the practice which I have had, I have found that ashes are a deodorant, and with our present system of drainage I have discouraged waterclosets wherever I could, particularly among the poorer classes, and for this reason, they get out of repair from children going, and so on, and they get to be a much greater nuisance than privies. When privies become a nuisance there is a mode of getting rid of the refuse, but in the case of waterclosets, they are neglected, and there is a bad smell, and the people suffer, and they do not know what from. I sometimes find that they are weeks or months suffering from the bad effects. Frequently in the case of respectable houses I have been called in, and have found that the waterclosets have been entirely untrapped and have been ventilating into the houses.

12,529. Your surveyor has told us to-day that your sewers are not ventilated?—They are not except by the house falling spouts means of ventilation. I have had an idea in my own mind for some time of ventilating the sewers. I do not know the patent which has been obtained, but I think that our mill chimneys would make first rate ventilators to main sewers. I have thought that an arrangement might be made by the corporation paying an acknowledgment, and that those sewers which are at the upper part of the town connected with the mills and furnaces, would be much better ventilated in that way than by any other system. That is an idea of my own.

12,530. In the city of Carlisle we connected the sewers with the mill chimnies in six or seven cases. Of course the first consideration of the millowners is to maintain their own draught, and every extra inlet into the chimney diminishes their draught. If they would let you pass a 9 or 10-inch flue into the chimney it would be good, but it would not be so good as making numerous ventilators throughout the town. You would not be safe trusting to mill chimneys alone without other means?—I am very much obliged to you for making that statement.

12,531. (*Mr. Harrison.*) When new buildings are erected have you any supervision as to the ashpits?—There is an improvement committee of the corporation, and all building plans go before that committee and before the surveyor. Of late the corporation have taken great pains not to allow anybody to build conveniences over the river, but of course they allow privies, and they are now constructed in most cases so that the ashes will mix with the night-soil. A great evil in Halifax has been in having ashpits placed beyond the row of privies; there is a little hole, and the ashes are just dropped in and never get near the soil, and the soil exposed to the rain and sun has caused a great nuisance; but that matter has been

HALIFAX.

Mr. S. Magson.

17 Nov. 1866.

looked to lately, and the ashes have been put upon the night-soil.

12,532. In the case of those ashpits which have been constructed under the inspection of the borough surveyor, have you found any injury arising to health?—No; whenever I have found ashpits so constructed that the ashes could get upon the night-soil the privies have been almost completely deodorized as compared with others. There is another thing which I wish to mention, namely, that in many parts there is a sort of natural giving in of the ground, and many of those places have had to be drained, otherwise the water begins to ferment and becomes a very great nuisance.

12,533. If there are ashpits of that kind, it becomes of great importance to keep all the water out of them?—It does.

(*Mr. Norris.*) There is one circumstance connected with Mr. Magson's evidence which I should like to get upon the notes, namely, that by our bye-laws we do not allow any privy to be erected within five feet of any door.

The witness withdrew.

Mr. G. D. Malam.

Mr. George Dunbar Malam (Halifax) examined.

12,534. (*Chairman.*) You are manager of the Halifax Gasworks?—Yes.

12,535. Do they belong to a company?—They belong to the corporation.

12,536. Where are they situated?—They are situated partly on the banks of the Hebble at the foot of Beacon Hill.

12,537. How many retorts have you now in use?—238.

12,538. What is the cubic volume of gas which you produce annually?—Close upon 160,000,000 cubic feet.

12,539. What weight of coal per annum do you use?—About 17,000 tons.

12,540. What kind of coal?—Lancashire cannel, Yorkshire cannel, and Yorkshire coal.

12,541. Do you use earthenware retorts, or iron ones?—They are all earthenware.

12,542. What weight of tar do you make per annum?—Nearly 900 tons.

12,543. What weight of ammoniacal liquor do you make?—About the same quantity.

12,544. Have you any difficulty in getting rid of your tar and ammoniacal liquor?—Not the slightest, we sell it all.

12,545. What do you get for your tar?—18*s.* 6*d.* is the highest price to the contractor, but the burgesses I believe pay something more. I think that 1*l.* per ton is the highest price.

12,546. What do you get for your ammoniacal liquor?—That is taken in bulk.

12,547. What do you get for it per annum?—365*l.*

12,548. What do you purify with?—Oxide of iron principally.

12,549. Do you use oxide of iron exclusively?—We mix a little lime with it.

12,550. What amount of refuse have you per annum from the lime?—The materials are all mixed up together, and the refuse is taken away by the person who supplies us with the oxide, in order to manufacture sulphur.

12,551. Then you have no refuse from purifying upon your premises?—Not at the present moment; in the last two or three years we have had probably 200 or 300 tons of refuse oxide.

12,552. Because the manufacturer did not choose to take it away?—Just so.

12,553. Have you made a bargain with him to take it away?—I do not think that there is any bargain with him that he shall take it away, but I think that it is optional.

12,554. Is it a nuisance while remaining?—Not at all.

12,555. Is the lime a very great nuisance?—Yes, because sulphuretted hydrogen would be evolved into the atmosphere.

12,556. Is there any refuse in your manufacture which you cannot dispose of?—None at all.

12,557. Do you pass anything whatever into the streams or sewers?—Not now.

12,558. Did you do so some years ago?—Two or three years ago we did.

12,559. Neither tar, ammoniacal liquor, nor any solid refuse now passes into the stream?—No.

12,560. What amount of coke do you produce per annum?—Between 7,000 and 8,000 tons for sale.

12,561. Do you find a ready disposal for it?—Occasionally we do, when the weather is suitable for the consumption of fuel.

12,562. You use a portion of it for your own processes?—Yes.

12,563. I suppose that you distil your coal by it?—Yes.

12,564. Do you make any smoke on your premises?—No.

12,565. No smoke passes from your chimney?—No.

12,566. How frequently do you find it necessary to change the water in the gas tank wells?—We do not change it at all. The only instance where any tank is emptied would be in the case of telescoping a single lift as was done I believe two years ago.

12,567. You do so only in the case of some radical alteration being required?—Yes.

12,568. What is the net profit which you make for the corporation in your manufacture?—I am informed by the borough accountant that the gross profit is upwards of 11,000*l.* a year, and that the net income is about 4,000*l.* a year.

12,569. What do you charge consumers for gas for shop purposes; how much per 1,000 cubic feet?—4*s.* in the borough; then there is a discount.

12,570. And your larger consumers have it for less?—Yes, I believe that the lowest price comes down to 3*s.* 2½*d.*

12,571. Have you ever applications from residents in the neighbourhood for you to allow them to bring their children into your purifying house when they have croup or measles?—Yes, very often.

12,572. What are the diseases for which they think it good?—They think it good for croup.

12,573. Are many children brought to be put into the purifying house?—Yes; at certain seasons of the year. I think that they come principally in the winter time.

12,574. Do you think that it does them any service?—No doubt of it.

12,575. Are your men a healthy class of men?—Undoubtedly so; they are free from almost every form of disease except what they bring upon themselves by inebriety.

12,576. So far as your knowledge and experience goes there is nothing injurious to health in the manufacture of gas?—I have lived all my lifetime either on gasworks or next door to them, and I do not consider myself an unhealthy man, or unable to do a day's work with any man of my own age.

12,577. Do you observe any nuisance?—No; there may be a nuisance to a stranger. Occasionally there is a little nuisance when the purifying vessels are first opened; there is then a slight trace of sulphuretted hydrogen, and of course that is not pleasant.

12,578. How long has the practice existed of mothers wishing to bring their children into the purifying house?—I have known it since I was a child.

12,579. Are more children brought now than were at first?—No, I do not think that people know the value of it, or else they would avail themselves of it more than they do. You may have seen it stated in the newspaper, that some Parisian doctor has lately referred to the use of it as if it was some new discovery, whereas it is as old as my recollection.

The witness withdrew.

HALIFAX.

Mr. J. Beaumont.

17 Nov. 1866.

Mr. JOSEPH BEAUMONT (Elland) examined.

12,580. (*Mr. Harrison.*) Are you a manufacturer?—No, I am a finisher of woollen cloths, and we require clean water for our purposes.

12,581. Where are your works situated?—At Elland.

12,582. Is that on the banks of the Calder?—Yes.

12,583. Is it below the confluence of the Hebble and the Calder?—Yes.

12,584. Does the Calder and Hebble Canal pass near your works?—Yes.

12,585. Is the water with which the Hebble Canal up to Halifax is supplied pumped from the river Hebble?—Yes.

12,586. Does that water contain the sewage of Halifax besides other impurities?—Yes.

12,587. Is there a deposit in the canal from that water?—Yes.

12,588. How do the canal company get rid of that?—We should not complain if they did not continue the open sluice sometimes for 12 or 14 days in succession, during the whole of which time we have dirty water; we suffer so greatly from it that we might as well give up our business during that time.

12,589. How frequently does such an interference with your trade occur?—Every summer.

12,590. Are you dependent upon the water of the Calder for washing your goods?—Entirely.

12,591. And this occurs every summer for about 14 days?—Yes, and it is not only that, but they have sluices on various parts of the canal above us, and at certain periods they open those sluices and send down the water by sludging or dragging to the mouth of the sluice.

12,592. How many hands have you employed at your works?—We are fulling millers; we employ about 20 hands.

12,593. And for the time which you have mentioned those hands would be all thrown out of work?—The water has been so very dirty that we have had considerable complaints with respect to our goods.

12,594. Is it sometimes sent down without your knowledge so that you go on using the water?—Entirely so; they have not given us any notice.

12,595. Therefore you are interested in some remedy for the present pollution of the rivers and of the canal adjoining?—Especially so; the river Calder is at a certain time in summer a boiling stinking mass which everybody has to pass in going over Elland Bridge in order to get to the railway station. We receive not only that but all the Halifax sewage.

The witness withdrew.

Adjourned to Monday next at 10 o'clock, at Todmorden.

Todmorden, Monday, 19th November 1866.

PRESENT:

ROBERT RAWLINSON, Esq., C.B., IN THE CHAIR.

JOHN THORNHILL HARRISON, Esq.

TODMORDEN.

Mr. W. Sutcliffe.

19 Nov. 1866.

Mr. WILLIAM SUTCLIFFE (Todmorden) examined.

12,596. (*Chairman.*) Are you a resident in Todmorden?—Yes.

12,597. Do you carry on any business here?—I am a corn miller.

12,598. Where is your mill situated, how far from the town?—About half a mile, it is Stansfield Mill.

12,599. Is it above or below the town?—It is below the town, on the Halifax Road.

12,600. What amount of power do you use?—I employ two 12-horse engines and a water-wheel.

12,601. Of what power is the water-wheel?—I have not had that tested.

12,602. What number of stones can it drive?—At first it drove seven pairs of stones; I can now drive about five.

12,603. What power does it require to drive the stones?—Some corn millers estimate that it requires 3-horse power, and some 4; but it will depend entirely upon the amount of feed upon the stones.

12,604. It is not so low as 2½ horse power?—No.

12,605. How many dressing machines do you drive?—I have two silk-dressing machines; they do not require much power; I have six pairs of French stones, and a pair of grey stones for Indian corn or oatmeal.

12,606. How long has that mill been established?—The present mill was built, I believe, in 1804; but there was one prior to that.

12,607. How long have you been lessee of this mill?—I am owner, and have worked the mill ten years.

12,608. You said, I think, that you have not so much water power now as you had formerly?—I have not.

12,609. Has the mill-tail goit sometimes been choked up?—The last winter the Todmorden gas company threw in all their ashes into the river at the outlet of my tail goit, and they have raised the tail goit, and the bed of the river has been raised lower down.

12,610. Did you remonstrate against that?—Yes, I brought an action against them, and obtained 150*l.* damages.

12,611. Did you consider that that was as much as you ought to have had for the damage you had sustained?—No.

12,612. You would rather have had your power not interfered with?—Yes, I should have preferred that.

12,613. (*Mr. Harrison.*) I presume the gas company are restrained from running their refuse into the river?—They have not done it since I got the verdict.

12,614. How is it that your power is now reduced from seven pairs to five pairs of stones?—The reduction is in consequence of the deposit lower down the river, below the gasworks.

12,615. Have you taken any steps to prevent that?—The law proceedings have not yet terminated.

12,616. Have you brought any actions against other parties besides the gas company?—No, I have not.

12,617. What amount of coal do you burn at your steam mills?—It is very uncertain; it depends upon the supply of water.

12,618. Do you burn 50 or 100 tons in a year?—I cannot say.

12,619. Do you burn 50 tons?—It depends entirely upon the water.

12,620. Whatever the weight may be, what do you do with the ashes?—I use them to repair roads, and for draining purposes; I have never put any into the river.

12,621. Do you put any refuse of any kind into the river?—Some six or seven years ago, when I cleaned out my head goit, the refuse that had come out of the river into my head goit I put back into the river below my weir.

12,622. Do you consider that the introduction of general restrictions against putting solids into the river would be a great hardship?—I do not presume that it would be, as far as I am concerned.

12,623. If all persons were compelled to keep their refuse out of the river, you would not object?—Not at all.

12,624. What amount of costs did the law proceed-

TODMORDEN.

Mr. W. Sutcliffe.

19 Nov. 1866.

ings entail upon you?—I have not yet received the account; but I do not think that the 150*l.* will cover my costs, besides the annoyance.

12,625. It was the case of one neighbour prosecuting another?—Yes; and I would rather not do that, if I could avoid it.

12,626. Are not ashes and refuse thrown into the river above you by other persons besides the gas company?—Yes.

12,627. Is it not a general practice here to throw solids into the river?—Yes; the river is the common receptacle for everything.

12,628. Road scrapings, and all?—Yes.

12,629. At the bridge there was a great collection of cinders, which the flood has partly taken away?—Yes.

12,630. Did not those cinders come from the dwelling houses?—I presume so.

12,631. Have you been flooded during the last week so as to stop your works?—Yes.

12,632. Are you frequently stopped in that way?—No; the water ran through my mill nearly all that day. On Friday last I was prepared for it; one of my men called myself and my sons up about 5 o'clock in the morning, and we cleared the mill bottom, or I might have been seriously damaged. I had a large amount of flour in the mill bottom.

12,633. It would cost you a considerable sum, I suppose, to clear the mill?—I had to pay all the men for Friday last, for merely looking after the flood.

12,634. Do you think that the flood was higher than it would have been, from the river having gradually silted up?—No question of it.

12,635. If the same thing goes on, I suppose the river will naturally silt up still higher?—No doubt. In some places it has silted up very much now; I can see it now that the flood waters have abated.

12,636. Have any other manufacturers suffered from the flood?—I believe they have.

12,637. Did the water come into the mill floors?—Yes.

12,638. What accommodation have you provided for your men in the shape of privies, or ashpits?—I have none about the mill.

12,639. Where then do the men go?—There is a privy up at the cottages above.

12,640. Is that refuse passed into the river?—No, it is not; it is carted on to land.

12,641. Have you observed, since the late flood, whether the bed of the river is altered below your mill?—Opposite to my mill it is higher than it was prior to the flood.

12,642. Has the water tailed back against your water-wheel, in consequence?—I have not paid particular attention to that this morning.

12,643. The bed of the river, you think, has been raised?—Yes, opposite my mill; but the outlet of my tail-goit is considerably below it.

12,644. It is generally supposed that a flood clears out a river, but your experience is that the recent flood has raised the bed of the river at one point?—Yes.

12,645. The tendency is to clear it away in some parts, and to form banks in others?—Yes; it may clear it away in one part, and deposit it in another.

12,646. The result of such an operation is, to increase flooding upon adjacent land?—Yes.

12,647. Was much land below Todmorden flooded?—The whole valley.

12,648. Is land injured by flooding?—Unquestionably, there is a great deposit of mud and sand.

12,649. And all kinds of refuse?—Yes.

12,650. Will that injure meadows for some time to come?—Yes; before grass can get through this deposit will have to be scraped away.

12,651. (*Chairman.*) Do you know what quantity of rain fell last week, on the days which preceded the flood?—No.

12,652. Have you no rain gauge at Todmorden?—No.

12,653. Do you know what height the flood rose from the lowest level up to the highest; did it rise as much as 10 or 12 feet?—No; I should think not so much as that, but from six to nine feet. I have not measured it.

12,654. Was it a greater flood than you remember before?—No; I think I can remember as large a flood in my time.

12,655. When was that?—Perhaps 20 or 30 years ago.

The witness withdrew.

Mr. John Buckley (Todmorden) examined.

Mr. J. Buckley.

12,656. (*Chairman.*) What business are you engaged in?—I am a boiler maker.

12,657. Where are your works situated?—At Gorksall.

12,658. Upon the banks of the river?—Not exactly.

12,659. Are you affected by the river at any time?—Not at all.

12,660. How many men do you employ?—32.

12,661. Have you any privies or ashpits on your premises?—Yes.

12,662. Are their contents emptied into the river?—No; we cart them away.

12,663. Were you affected by the flood during the last week?—No.

12,664. Are you a member of the local board here?—Yes.

12,665. Do you know whether the local board has anything to do with cleansing the river?—I am not aware of it.

12,666. Have any questions been brought before you and discussed as to solid matters being thrown into the river?—The subject has been occasionally mentioned.

12,667. Ashes and road scrapings are thrown into the river, are they not?—Yes.

12,668. Do the men who work upon the roads for the local board throw road scrapings into the river?—I cannot speak to that; the local board does not scrape the roads, that is done by the highway surveyor.

12,669. Has not the local board charge of the roads?—No, not particularly.

12,670. (*Mr. Harrison.*) Do you use steam power?—Yes.

12,671. What do you do with the ashes?—We throw part of them into the river.

12,672. (*Chairman.*) Has any person remonstrated with you for doing so?—No.

12,673. Do you know what weight of ashes is thrown into the river in a year?—Not exactly; we do not throw in much.

12,674. Is there any difficulty in keeping them out?—The only difficulty is to find a place for them; I should not know where to cart them to.

The witness withdrew.

Mr. Robert Fielding (Todmorden) examined.

Mr. R. Fielding.

12,675. (*Chairman.*) What is your business?—I am a spinner and manufacturer.

12,676. What is the name of your works?—I have Birks Mill and Hoyle Bottom Mill.

12,677. Are they both on the river?—Not exactly; they are neither of them close upon it.

12,678. Where do you get your water from?—From the land above.

12,679. How many hands do you employ?—I cannot tell, probably 250; mine are cotton mills.

12,680. What weight of coal do you consume in a year?—I do not know.

12,681. What is the power of your engines?—We have two 20-horse engines.

12,682. What do you do with the ashes?—Some-

times we throw them into the brook, and sometimes we cart them away.

12,683. Then you just do as you like with them?—Yes.

12,684. Have you privies and ashpits, or water closets, at these mills?—We have privies.

12,685. Does any of the refuse go into the river or brook?—Not that I am aware of.

12,686. Do you cart it all on to the land?—Yes.

12,687. Do you think the river is a proper place to put ashes in?—There is nowhere else here to take them to; some folks have no land to carry them to.

12,688. There is a railway is there not?—Yes.

12,689. Cannot they be taken away by the railway?—Yes, but that would be an expense.

12,690. (*Mr. Harrison.*) Do you think that the ashes you throw into the river deposit themselves in the bed below, and cause a nuisance to those who own water power and who have meadows on the banks?—There is no doubt that ashes so thrown in are the means of injuring parties below.

12,691. Would it not be right, therefore, that people should keep them out, and not injure others below?—Yes, but there are water weirs besides.

12,692. Do they stop ashes and other things?—No doubt they will.

12,693. If there were no ashes to stop of course they would not stop them?—No.

12,694. Do you think that the injury caused by the flood last week all down the valley was considerable to adjoining lands?—No doubt it was considerable.

12,695. And to mills?—Yes.

12,696. Has it not cost individuals all down the stream a considerable sum of money?—Yes.

12,697. Some lives have been lost?—Yes.

12,698. Any occurrence of this kind which raises the bed of the river and floods the adjoining land, causing at the same time bridges to be carried away, endangers not only the property on the banks but the lives of persons living there?—Yes.

12,699. Considering these things, do you not think that the government should take some steps to prevent solid refuse being thrown into the river?—No doubt it would be a benefit if there were a place provided to deposit ashes upon, but there is an immense quantity of wrack, or solid refuse, that comes down; thousands of tons in a year, which come down from the mountains in the shape of gravel and sand.

12,700. Is there much washed out of the quarries?—I should say not so very much out of the quarries, for they are at a distance.

12,701. Is there not a quarry below the town, and pretty close to the river?—Yes, there is one, but there is the canal between.

The witness withdrew.

Mr. Abraham Stansfield (Todmorden) examined.

12,702. (*Chairman.*) In what business are you engaged?—I am a nurseryman.

12,703. Where are your grounds situated?—About 300 yards from the side of the river.

12,704. Are your grounds liable to be affected by the river in time of flood?—Yes, they are.

12,705. Were your grounds flooded at all last week?—Yes, very seriously in the lower part of the nursery.

12,706. To what depth were your grounds covered with water?—From 18 inches to two feet deep at the bottom part.

12,707. Has the flood left a deposit of sand on the ground?—It has covered great plots of rhododendrons with mud, and the leaves are the colour of the road instead of being green; it has left a great deposit of very fine mud.

12,708. What do you think the damage will be to you individually by the flooding?—I do not think it will be very excessive, but we have suffered in the house as well as in the nursery, in the cellars; the cellars and kitchens have been very much flooded.

12,709. How long have you known this river?—For 55 or 60 years.

12,710. In that time has the trade of the district increased largely?—Yes, immensely; large cotton mills have grown up.

12,711. Is it the practice in Todmorden to throw ashes and solid refuse into the river?—It is, I believe, very generally.

12,712. Has that a tendency to lift up the bed of the river and fill the channel?—Not a very material tendency; I think the solid refuse would be carried away far off if the banks were kept up; it is the ruinous condition of the banks and the lowness of them that cause the filling up of the channel, for as soon as the debris gets down to a place where the water overflows the banks, the water breaks through the banks, and the refuse, instead of going down the stream, is left in the bed of the river and cannot be carried away.

12,713. The injury caused is not so much by filling up the bed of the stream as by breaking down the banks?—No, not so much; but the banks breaking down, and the pressure being taken off by the water flowing over on to the land, all the debris remains deposited which would be carried away if the water was kept in its right course.

12,714. Do you think that you would be justified in throwing solid refuse into the river, because it did not stop here?—No, I should be against putting anything of that sort in on many grounds, and one is that I think it is desirable that our river should be kept pure. I remember the time when there was abundance of fish here, now there are none; in consequence of the materials that are thrown in, the nastiness of the stream is prejudicial not only to the lives of fish, but generally, no doubt, also to the health of the people.

12,715. Do you not think that if 20,000 tons of refuse are thrown into this river, and none of it stops here, the probability is that the refuse settles somewhere else below?—Certainly.

12,716. It would tend to raise the bed of the river where the fall is not so steep as it is here?—Yes, at some points, where the channel is broad.

12,717. Although you might not experience the evil effects here, persons down below would where the river course is flatter?—Yes, unless the banks of the river were kept up, so that the water could be kept in; if so, I think it would go to the ocean, through the great estuary of Yorkshire; the force of the stream would increase the lower you go down, but as soon as the pressure is taken off by the water flowing over on to the fields, then the force of the water cannot carry the materials forward.

12,718. Are you aware that the bed of the river Ouse has gradually risen within the memory of boatmen working upon it?—No, but I have no doubt it is so in places where the channel has not been kept narrow.

12,719. Have you a rain gauge upon your premises?—Yes.

12,720. Do you know what amount of rain fell last week?—From Thursday morning till Saturday morning there were 3·94 inches.

12,721. Have you ever registered so heavy a rainfall before?—Never in the same time.

12,722. How long have you had a rain gauge?—We have only kept it registered for two years.

12,723. (*Mr. Harrison.*) How often do you record the rainfall?—Sometimes every day; not always; on Friday it was recorded. A record should have been made for Thursday, but it was so wet that no one would venture out, and the rain went on for 48 hours.

12,724. Can you give the rainfall for two years here?—Yes, I can. We are in connexion with the Bacup meteorological people, where they keep rain gauges, and we send our accounts there.

12,725. Have you observed whether when there is a certain amount of rainfall the water floods the adjoining land where you live sooner than it used to do?—No, I do not know that it does; I have not observed it. We should not have been flooded on this occasion if the banks of the river had been kept entire. It was entirely in consequence of the break in the banks of the river.

TODMORDEN.

Mr. A. Stansfield.

19 Nov. 1866.

12,726. Is it the duty of the local boards, or any persons, to keep the banks in order?—I think not. It is everybody's duty, and of course it becomes nobody's.

12,727. Would it not be advantageous if it was somebody's duty to see that the river was kept in order?—There is no doubt of that. It would be a benefit to every one if it were judiciously done, with economy and care.

12,728. Have you observed that the meadows all the way down are covered with debris?—Yes.

12,729. Is it your opinion that the damage done by the flood of last week was considerable?—Yes, very considerable. I should mention that the debris which is brought down by the river is not of a fertilizing kind. There are many little pebbles and much coarse sand and grit. It is not that fine calcareous mud that you meet with in limestone countries.

12,730. It is not like giving a warping below?—No; it is an injurious thing, and the mud has to be removed.

12,731. How do you manage in a case of this kind to set to work and remove that sand?—Men take it away in barrows where it is very thick; where it is thin they spread it over.

12,732. (*Chairman.*) Do they take it back to the river?—I should say not; but it may have been the case.

12,733. (*Mr. Harrison.*) After going to an expense to remove the sand, will much injury be done to the grass; will it recover itself next season?—I think there will be no material damage done if the sand is removed properly. I think it is a very important matter that fæcal matters should be kept out of the river.

12,734. Is it the common practice to place privies on the bank of the river, and so dispose of the refuse?—Yes, in many cases it is so; but in many cases the privies are emptied. We have a custom in some parts of the town, indeed the local board insists upon it, that the privies shall be provided with boxes.

12,735. Are you a member of the local board?—Not at present; I was formerly. Privies are provided with loose boxes, and these are kept in the petties until nearly full, and then they are taken away. In some cases they are taken to the river, but in others they are taken and emptied on to the land.

12,736. If some general regulation was laid down I suppose the boxes could all be removed with benefit to the land and to the inhabitants?—Yes.

12,737. Have you found the boxes to be a nuisance?—No; I think it is the best arrangement in these petties. You have the place very clean. When a box is washed out all the place is clean. It is not like having a cesspool which you can never have perfectly clean. In a box you can partially deodorize it by scattering a few ashes on the top of the fæcal matter, and when you clear out the box and wash it out it will be perfectly clean for a time.

12,738. (*Chairman.*) Have you seen the earth closet which has been invented?—No; but I have no doubt it is a very excellent thing, and that it would be better if it could be adopted in preference to a watercloset. These are a great nuisance here because the drains are very imperfect and bad.

12,739. Does the local board remove ashes from houses?—They do upon certain conditions. I do not know what the conditions are, but they will remove them upon certain conditions.

The witness withdrew.

Mr. Charles Chambers (Todmorden) examined.

Mr. C. Chambers.

12,740. (*Chairman.*) In what business are you engaged?—I am a cotton spinner.

12,741. Where are your works?—About 150 yards from this place.

12,742. On the bank of the river?—Close adjoining.

12,743. What number of workmen do you employ?—About 200.

12,744. How long have the works been established?—40 years.

12,745. What horse power do you use?—About 50-horse power.

12,746. What weight of coal do you burn in a week?—About 24 tons.

12,747. What do you do with the ashes?—I throw them into the river, and always have done for 40 years.

12,748. Have you any privy accommodation upon your premises?—Yes.

12,749. Does the refuse go into the river?—It used to go into the river, but the local board, two years ago, arranged to take it away at certain charges. Since then we have made various applications to them, but we have never been able to get it done. The cart, horse, and man have been away. We take it away ourselves: but the local board made an arrangement to take it away at certain charges, and they have not done it; we do it ourselves.

12,750. Are you a member of the local board?—I have been.

12,751. Have you any land of your own?—Not in the valley.

12,752. I mean that you could cultivate by applying sewage to it?—No.

12,753. Would it be expensive to you if you were told that you should not do as you had done before, but that you must get rid of the refuse in some other way?—I should be willing to submit to a cost of that sort if it was made a general law. I think it is proper that all persons should be put under one regulation.

12,754. Do the floods in the river interfere with or injure your mill?—Yes. During the last 30 years I have lost the whole value of my property by floods flooding the basement and the machinery, which might have been cured if there had been some central controlling power to have spent perhaps 400*l.* in regulating the river, keeping it within its channel, and lowering its bed. I believe that the trustees of the Todmorden Road have lost more money than would have sufficed for building once for all the entire side walls which they have only imperfectly put there again and again for their own protection.

12,755. Are the floods worse now than they were when you first knew the river?—I think not. There is a larger area of ground covered with buildings, and very great injury is done to the people in consequence; but for the last 40 years we have always been flooded. This is the first time that we have escaped for 40 years, and our escape has been due to the river wall having kept up this time. It has broken down from time to time, but fortunately for us this time it is so far perfect as to keep the house out of danger; but I know how to sympathize with my neighbours.

12,756. Do you believe that the damage done to property, not to speak of the loss of life, which has been very great, must be measured by tens of thousands of pounds?—I have no doubt that an outlay equivalent to the money value of the damage caused by every flood would entirely cure the mischief. I mean that within an area of three miles of this place the money required to repair the damage for four miles down here would be sufficient to keep the river entirely within its limits, and prevent us from receiving any injury whatever and suffering so severely as we do.

12,757. (*Mr. Harrison.*) You would like to see some authority whose duty it should be to prevent ashes and other solids being thrown into the river, and to look after the bed of the river to see that it was kept at a proper depth, and that the banks were properly secured?—Yes, I should like to see that done.

12,758. How would you propose to raise money to carry out the requisite works?—By a general taxation in the district.

12,759. Within what limits should you confine that in the case of Todmorden?—I do not know why it should not be taken out of the county rates. I do not like very narrow areas. I think that we all live for one another. We did it in this way in the case of the cattle plague, and I do not see why there should be any exception.

12,760. (*Chairman.*) Did you contribute any part of the rates to pay compensation on account of the cattle plague?—I believe about 1½*d.* was put on to meet the compensations; but we did not have a single cow die in this neighbourhood.

12,761. You contributed a portion of your rates to those who had suffered more severely?—Yes, we did. There are such a number of proprietors on the river, and to each individual of them belongs a natural right, I suppose, but if one proprietor on the river is perfectly prepared to put his property in order and provide the security necessary for our protection, perhaps his selfish neighbour below will not do the same, and if he leaves 10 yards of wall in want of repair, the whole mischief may be done.

12,762. No willingness on the part of an individual, nor any amount of expenditure he may go to, will avail, if, as you have said, some selfish individual will neither take part in the cost, nor do any of the necessary work?—That is it. I know that Messrs. Fielden, of Waterside, have a considerable portion of fencing along this road, and there is no division between the road and the river, except the fence; and Messrs. Fielden, of Waterside, have I believe rebuilt their wall frequently, and made it stronger, so as to keep the water within the river; but there are the trustees of the turnpike road, who have another length of river wall, and the rumour is that they do not hold themselves bound to maintain the river wall, so that it is left in an imperfect condition filled up with loose rubble, stones, and loose dirt put on at the top to make a sort of loose wall, the consequence is that we have been flooded half a score times; it has done me about 500*l.* worth of damage in one flood.

12,763. (*Mr. Harrison.*) Did you hear what Mr. Sutcliffe stated as to the diminution of the power of his water-wheel from seven to five pairs of stones?—Yes.

12,764. Is that the case with other water-wheels here?—I have no doubt at all that the mill goits are filled up with lighter debris, that we throw into the river; but there is a heavy material that we have nothing to do with, ours is the most innocent. The ashes that are put in are very little above the specific gravity of water, except the clinkers, which go to the bottom, and there are very few of those. A great quantity of our stuff, if the river walls were good, would go down by the river. The mischief that is done to people owning watermills is from emptying foundations of cottage houses, and throwing in large boulders. Any man who builds a cottage wheels all the foundation materials into the river; the mills do not; they have been walled since I was a boy.

12,765. Is there much dyeing done in Todmorden?—None, except what we do.

12,766. What dyes do you use?—Nothing but indigo.

12,767. Do you pass the refuse from the indigo into the stream?—We do as our neighbours do; we throw all sorts of muck into the river that we can.

17,768. Would you be willing to keep your dye refuse out of the river?—Yes, if you made everybody else do the same. I think we all ought to be compelled to do it.

12,769. Can you keep it out?—Yes, at an expense, and if we cannot, there are people in the world who will do it for us.

12,770. Have you anything further to add?—Yes. I stated before that I was not flooded at all, but my neighbours' dwelling houses were flooded as usual as deep as before; all their cellars were under water. The road for about half a mile above us is rather in a curve. The whole of the surface water is drained from the road into the river, and all the gullyholes are open between the river and the road. The drainage between the cottage houses goes across the road also, and the flood here has been entirely due to those openings in the river banks. The system of drainage through the streets would have taken that water away, but the water has been backed up through the gullyholes, and the houses have been flooded, not by any great and sudden overflow, but by what the slightest amount of science might have prevented.

12,771. You mean perhaps that they should have taken the sewer down to a lower fall, so that the water would not have reached up to the places that were flooded?—Yes; but the cottages are drained across the road, and the road is drained, and the gullyholes are all open and untrapped, so that there is no protection against the water coming out of the gullyholes that drain the ordinary surface of the roads.

The witness withdrew.

Mr. Thomas Edward Hamerton (Todmorden) examined.

12,772. (*Chairman.*) What business do you carry on?—I was a solicitor; but I have retired from business now.

42,773. How long have you known Todmorden?—Upwards of 40 years.

12,774. I suppose the population has largely increased since you first recollect it?—Very greatly indeed.

12,775. Has the mill power increased?—Very much; they are building larger mills.

12,776. Can you remember the river during the whole of that period?—A little. I did not pay very great attention to it.

12,777. Are there not injurious floods here occasionally?—Very injurious and very distressing floods.

12,778. Have there been any lawsuits between owners of mills, in consequence of the state of the river at any time, as to water rights?—Yes; there have been frequent disputes as to water rights. As to floodings, about 10 years ago there was a severe flood and an action was brought by one of the inhabitants, who was injured, against the trustees of the Todmorden Road, to recover damages against them; it was tried in the County Court here. The case was argued, and it was decided on that occasion that the trustees were not liable, therefore it was decided against the plaintiff.

12,779. (*Mr. Harrison.*) Was the damage done proved to have been caused by the washing down of any part of the Todmorden Road?—It was from the washing down of the embankment. There is a particular part of the road towards Burnley, where the trustees of the road had made an improvement, and the cost was so great that they became alarmed and discontinued it; and the portion of the embankment above that, is continually liable to be thrown down by the pressure of the water.

12,780. Is there anything further that you wish to add?—I do not know that there is, except this, that the recent flood has been caused by the breaking down of the embankment, and if the river embankments were made firm and sound, and the river was made of equal width, so that the pressure would be equal, I think it would then carry away all the wrack that is put into it at present. The river opposite to my house is a great deal narrower than it is down below, and in consequence when the water gets down below it spreads out, and the silt falls there, and that causes the river above to rise; now I daresay the river is a foot higher than it was two or three years ago, the height keeps advancing, and in the recent flood, notwithstanding all the water that flowed out of the river through the breakage in the embankment, the river overflowed the bank opposite to my house, which it never did to that extent before. That shows that the water in the river, and the bed of it, are raised a foot higher, and that causes the water to overflow the bank. If the river had been made of a proper width, the flow of the water would have carried away the whole of the wrack.

12,781. Do you think it is advisable to place the river under the control of some governing body?—I do.

12,782. Whose duty it should be to keep the bed of the river in proper order, and to see that the banks were properly kept up?—Yes, I think it would be an excellent thing to do that.

12,783. Do you also agree that the district to be benefited by such a proceeding, or the whole county, should be made responsible for the expenditure?—I think the whole county; the matter should be a public thing.

TODMORDEN.

Mr. T. E. Hamerton.

19 Nov. 1866.

J. Fielden, Esq.

12,784. (*Chairman.*) You think that the rivers belong to the county, and the county ought to maintain them, not the manufacturers?—Yes.

12,785. As the manufacturers are rated the heaviest they would necessarily have to pay the largest amount?—Yes, they would.

The witness withdrew.

JOSHUA FIELDEN, Esq. (Todmorden), examined.

12,786. (*Chairman.*) Are you a member of a firm carrying on business here?—Yes; I am a member of the firm of Fielden Brothers.

12,787. Are you cotton spinners?—Yes, and manufacturers.

12,788. How long have your works been established in the Valley of Todmorden?—I cannot say.

12,789. Were they established by your father or grandfather?—By my grandfather, who came down into the vale from the hills in about 1783.

12,790. You are I believe some of the old manufacturers in the country?—Yes, certainly as cotton spinners.

12,791. Have you more than one mill here?—Yes, we have many mills in this valley, we have five mills on this river, and we have several mills on the tributaries to the river up in the hills.

12,792. What number of hands do you employ?—About 2,000 when all the machinery is at work; it is not all at work now.

12,793. Have you any idea what weight of coal you burn per annum at your several mills, or what horse power you employ?—At all the mills we employ from 500 to 600-horse power, and we burn many thousands of tons of coal per annum, perhaps 700 tons a month, or more than that.

12,794. Is it brought to you by railway?—A considerable quantity is got in the valley, up towards Bacup; we buy it there.

12,795. What does the coal cost you a ton here?—Engine coal varies according to the place it comes from, some of it will cost from 6*s.* to 7*s.* a ton, and other coal will cost from 7*s.* to 8*s.* a ton.

12,796. What do you do with the ashes that are made at your mills?—We put the whole of them into the river, and always have done so, at least ever since I can remember, and I have no doubt it was so before.

12,797. Are any of your mills situated immediately on the banks of the river?—Yes, nearly all of them.

12,798. Have they at any time suffered from flooding?—The largest mill at Waterside has.

12,799. Did it suffer last week?—Very little, but previously it did. We have never suffered to the extent that other persons have. All that we have suffered has been from the water getting in two or three inches deep, and leaving a deposit of mud on the floor; we have never had goods destroyed.

12,800. Not so much as Mr. Charles Chambers?—Nothing like it.

12,801. Has the bed of the river risen since you first remember it?—There are two rivers; one is the Walsden water, and the other is the Burnley river, they join in the town. The bed of the Walsden river has not risen, I believe, and during this flood, although I believe the water was as high as I have ever seen it in this river, it did very little damage, because the bed has not risen; the walls kept the water in. The most disastrous flood that I remember in this valley was in 1851; I think the water then came over the wall, above the toll bar at the end of our works.

12,802. Do you consider that you have acquired what is termed a prescriptive right to turn ashes into the river?—We believe so. I may mention that throughout this particular district the effects of a flood may result, not from the height of the water, but from a fence breaking down, and the water inundating certain portions of the district. In 1851 it was noticed that the water ran over the wall I have named. It broke down and the district was inundated. On Friday I noticed that it went over that wall, but the wall did not break, and consequently we were not inundated. If the wall had broken, the flood would have destroyed a good deal of property—not houses, but it would have inundated them and caused a great amount of misery. The bed of the river in the Burnley valley certainly has risen. People who have lately died have told me that they could remember the time when they had seen a cart and horse driven under the bridge at the higher lodge at the Centre Vale, but now I do not believe that a little child could go under.

12,803. Then it must have been raised there many feet?—Yes six or seven feet, and I believe that that has been owing to the diversion of the river made by the railway company when the railway was laid down from the Shunley valley. There is a chapel at a place called Patmos, and from that point the river took a straight course down to above Mr. Sutcliffe's mill at Stansfield Bridge. Now it comes into the Walsden River at a sharp angle almost at right angles, and the length of the river is increased. The bed of the Burnley River has been raised, and the effect has been that the floods have been more disastrous than before the rivers were altered.

12,804. (*Mr. Harrison.*) You would argue that there should be some control in order to prevent works being executed that should cause such a deposit?—Decidedly.

12,805. (*Chairman.*) Do you consider that your firm has a prescriptive right to pass solid refuse and ashes into the river?—We think so, and for this reason. There was a trial about it, and an attempt was made by some millowners down the valley to prevent the ashes going in.

12,806. When did the trial take place?—Some years ago. An association tried the question; the party proved that he had been in the habit of putting in ashes for 20 years, and the judge ruled that he had acquired a right.

12,807. I believe it was stated at Halifax, that an association binding each other not to pass solid refuse into the river was formed there, and that they endeavoured to induce the manufacturers in Todmorden to adopt the same regulations, but you declined?—I do not remember that circumstance, but we rather gathered that they were determined to make us.

12,808. If you were compelled to provide some means for disposing of your ashes, I suppose it would cost your firm a considerable sum per annum?—We should have to cart the ashes away to some place.

12,809. You would have to do as the Swansea copper smelters do, make a spoil bank?—Yes, we should have to put them on to the land, or sell them, and it would of course be more expensive; now we wheel them into the river, then we should have to pay for carting them away.

12,810. You would be at no greater disadvantage than many scores of manufacturers who formerly put their ashes into the river in such places as Wakefield, Bradford, and Halifax, but who now, by an arrangement of their own, do not do so, for they have them carted away at a cost sometimes of 1*s.* a load?—We should be like everybody else, if we had to conform.

12,811. Is there any chance of your sending the ashes away for ballast?—I think not, because there are so many in this place; I do not think the railway could take them all.

12,812. (*Mr. Harrison.*) At the present time the solid refuse passes down the river, it receives a check at each weir, and is passed on or removed by the millowner, eventually towards Wakefield; it is then dredged out by the Aire and Calder Canal Company?—Yes, it passes away somewhere, and I think when the river becomes wider and less forcible in its career, it will deposit, that is the effect in all rivers.

12,813. (*Chairman.*) The fact that the bed of your river here is not raised very rapidly cannot be taken as a proof that the bed of the river is not raised in some parts of its course where its flow is slackened, and the fall is very much less?—No.

12,814. (*Mr. Harrison.*) You would admit I presume that the passing of your ashes into the river here does cause expense to individual millowners below, and to the Aire and Calder Canal Company who have to dredge them out?—I think it must do so, but I do not think that the ashes will cause so much

obstruction as the solid matter. The ashes are very light, and they will go away almost to sea in a flood; they go at once, but the solid matter, as Mr. Chambers said, which is taken out from foundations of houses will no doubt be deposited sooner. And then there is an immense amount of rubbish that comes down from the hills with every flood, because the waters gather on these moor lands, and rushing down the narrow rivulets bring all the rubbish in these channels down into the river, and that is the deposit which I think is most objected to.

12,815. (*Chairman.*) You know the character of the mountains and rivulets in this neighbourhood, would it be very expensive to make refuse traps by putting strong rubble walls across the ravines so as to check the rolling down of grit and stones to the valley below?—It would be expensive, but I think it might be done.

12,816. (*Mr. Harrison.*) Are you aware that it has been done on the river Aire?—It has been done here. I have done it. There was a culvert just above this place, which was constantly getting filled up. The railway company and the trustees of the turnpike road agreed with me to repair the culvert, and to make a wreck-dam, as it is called, to prevent the culvert being filled with the rubbish. The wreck-dam is emptied out after the flood has passed away.

12,817. If the river was to be put under a Conservancy Board, I suppose it would form part of the general arrangements that they should look after that matter?—Yes.

12,818. Have you considered the desirability of a Conservancy Board for rivers situated as these are, where so many interests are concerned, and so many persons are liable to suffer by neglect?—I think there ought to be some authority to deal with these matters.

12,819. Suppose, for example, that the manufacturers here have the power to elect a Conservancy Board, which should have the general regulation of the entire drainage area of the rivers with a power of appeal to some government authority?—I have not thought of the matter yet in that light.

12,820. Should the expense be provided for out of the county rate?—I think such a scheme would pay us here well, if we could so work it as to cure the evil; individuals cannot do it.

12,821. Large as your firm is you could not, I presume, put your own property into such a condition as to be absolutely secure, if other persons had power to do something contrary to your interests, which they might think was for their own advantage?—No, we could not, and for this reason: If we were to put the river here on both sides into repair, and persons above us left the banks insecure, in a time of flood the waters would break through and come down upon us as they do now.

12,822. Although the common law is very powerful, you could not recover damages from a person who neglected his property?—No.

12,823. And I assume that you do not consider it very satisfactory that one neighbour should be compelled to take proceedings against another?—No.

12,824. You would not like to be sued by some of your neighbours down the river for polluting it with ashes?—No.

12,825. You would rather be ruled by some general law, and you would prefer that all persons throughout the country should be treated as one and the same?—Yes.

12,826. You would be willing to be put under some general system which had received careful consideration?—Yes.

12,827. (*Mr. Harrison.*) Do you employ any water power?—Yes.

12,828. Have you found it injured at all by the the condition of the river?—No, not permanently; in one place the water-wheel gets stopped in a time of flood.

12,829. What arrangements have you made in the way of privy accommodation for your hands?—The soil is all collected in boxes and is put on to a midden, we then cart it on to our own land.

12,830. You do not allow it to pass into the stream?—Never; we always keep it out because it answers our purpose for the land.

12,831. Do you dye at all?—No; I believe that Mr. Chambers has the only dyeworks here, except one other person who does a little.

12,832. Is there any refuse from your manufactories that passes into the river?—Nothing except ashes.

12,833. (*Chairman.*) Every other form of waste is collected and disposed of?—Yes.

12,834. The only difficulty you would have would be in finding a place on which to store the ashes?—Yes.

12,835. Otherwise it would be merely the cost of carting them away?—Yes.

12,836. (*Mr. Harrison.*) You have stated that you get some coal from a colliery in this neigbourhood?—Yes.

12,837. According to the geological map before me, the coal field does not appear to extend within many miles of Todmorden?—There is a large coal field all about Todmorden up the Burnley and Bacup valleys.

12,838. Is there anything further that you wish to add?—I believe that the inhabitants of this district are willing to do whatever they can to prevent such disasters as have occurred. The local board some time ago had this subject brought to their notice, and they certainly were inclined to deal with it, but the board had no powers. The clerk advised them that they could not recover the rates levied for such a purpose.

12,839. You are a member of the local board?—Yes.

12,840. Did you borrow any money under the Government grant of 1863?—No.

12,841. You maintained your own poor at that time?—Yes.

12,842. Have you received since that time a sum of money from the Central Relief Committee?—Yes; the district of Todmorden received about 5,000*l.*

12,843. You did not borrow any money for any public purpose?—No.

The witness withdrew.

JOHN FIELDEN, Esq., (Todmorden), examined.

12,844. (*Chairman.*) You are chairman of the local board?—Yes.

12,845. Do you corroborate the evidence given by your brother?—Generally I do.

12,846. Do you think it necessary that some better power should be exercised over the rivers of this country?—Yes.

12,847. To prevent their obstruction by solids and general pollution?—I think so. I think it would be very desirable if it could be carried out.

12,848. Do you think that if certain regulations were put in force, your firm would be put to any considerable annual expense to get rid of the ashes?—Yes, but I suppose we should get over that. I do not know whether the question of the coal pits has been mentioned. The pollution generally commences there, I think.

12,849. At the coal mines I suppose they pass the water into the river?—Yes.

12,850. It is ochrey?—Yes.

12,851. Is there any dyeing or washing with that water, or do you wash your warps?—No, we size them.

12,852. Are there any bleach works here?—No.

12,853. Is water used to any extent for washing cotton?—No.

TODMORDEN.
J. Fielden, Esq.
19 Nov. 1866.

12,854. There is not much liability to injury from the ochrey character of the water?—No, but the water is so much damaged by the refuse that comes out of the coal pits that we cannot use it for the boilers at our works. We have therefore made reservoirs on the tops of the hills, and we collect water from the moors and use that instead of the river water.

12,855. Do you think that coal miners should be compelled to provide a place of deposit for the foul refuse which they pump out of their pits?—Certainly.

12,856. And that there should be one law for all?—Yes.

12,857. (*Mr. Harrison.*) Have you known of any attempt being made to deposit that ochrey matter?—No, I have not heard of any expense being incurred for that purpose. We are anxious to get coal from the neighbourhood if we can, and perhaps some general rate, or some commission, which should have power to take the necessary sum from the county rate, in order to supervise this district, and carry out any improvements that might be deemed advisable would be better than individual action.

12,858. What is the population of the district?—I think it is 14,000.

12,859. Is any system of drainage carried out in Todmorden?—A very bad one, I believe.

12,860. You have the old highway drains?—No; there is a sewer carried down a certain district called York Street, but it is not a good one. We intend to call in a proper person—an engineer—to give us an estimate.

12,861. Have you any land adjoining the town that would be suitable for irrigation?—Scarcely so. About two miles down I think we might get a place, but here it is rather difficult; any land that we have here we prize very highly; I mean any level land.

12,862. Does the health of the inhabitants of Todmorden come under your notice as chairman of the local board?—We do not take cognizance of that, there are no reports sent in to us, as a board, about the health of the inhabitants.

12,863. Do you know what the health of the town is as compared with other towns?—I think the mortality is not greater than in other towns.

12,864. Do you know what the death rate is?—I do not.

12,865. Do you agree with the chairman as to the propriety of taxing the county for inspection and improvement of the rivers?—Yes. I do not see that there is any better plan.

12,866. Would you have any special taxation in the case of improvements made in towns like Todmorden and Halifax?—I think the funds would come perhaps most fairly out of the county rate.

12,867. If a river was pitched and walls built on each side, so as to confine the water for the special improvement of a town, do you think the whole county would be properly taxed for that?—I think where there is a boundary taxation might be confined within that boundary; perhaps such as a borough, or the jurisdiction of local boards, but I have not sufficiently considered that question.

12,868. (*Chairman.*) That would be breaking every area up into sections; a river is co-extensive not only with one county but with several, it passes in and out, irrespective either of township, parish, or county boundaries?—Yes.

12,869. Any damage done to that river is more or less felt throughout the whole area, and any improvements affected in it would be more or less beneficial throughout the whole area?—Yes, but this is a question that one cannot answer very easily off-hand, it requires a good deal of consideration.

12,870. Supposing the legislature was of opinion that the manufacturers caused all the mischief and determined that they should pay all the costs?—I should oppose that certainly. The manufacturers do not cause all the injury without conferring some benefit; they bring occupation at the same time.

The witness withdrew.

Mr. P. Ormerod.

Mr. Peter Ormerod (Todmorden) examined.

12,871. (*Chairman.*) What business are you engaged in?—I am a cotton spinner and manufacturer. We have one mill in the town, and another in Walsden, mile and a half from here.

12,872. How many hands do you employ?—600 or 700 at the two mills.

12,873. Are the mills situated near the river?—Yes, one is. Walsden Mill is over the river.

12,874. What weight of coal do you burn in a year? We burn nearly 100 tons a week.

12,875. What becomes of your ashes?—In Walsden we put them into the river, at the other place people want them generally. We take them on to some vacant land, and people take them away, the railway company and others.

12,876. Would it be a very great hardship to you if you were told that you should not put the ashes into the river again?—If it were made a general thing we should of course give in to it—it would certainly be attended with some expense.

12,877. But you think you ought to meet that do you not?—Yes, in some shape, if it was made a general thing.

12,878. Have you suffered at all from the recent flood?—Not this time.

12,879. Have you suffered from any flood before?—Yes, we did in 1859 at Walsden.

12,880. Do you know whether any millowners down the stream have suffered from the last flood?—Not in Walsden. When we were injured in Walsden it was by some timber coming down and getting across the arch under our mill; the timber came from the railway and other places, and the water brought down a great quantity of timber.

12,881. Did you take any proceedings against the railway company?—No.

12,882. I suppose you would rather suffer some damage than go to law?—We had no very great damage to suffer, but we do not like to go to law; there was other timber as well as the railway company's, trees that had been sent down the river from places higher up, and which had slipped down out of the hill sides.

12,883. Did you hear the evidence given by Mr. Chambers and by Messrs. John and Joshua Fielden?—Yes.

12,884. Do you agree with the evidence which has been given generally with regard to the causes of the pollution of the river and the proposed remedies?—Yes, generally I do.

12,885. Do you think it is necessary that there should be some restrictions enforced in order to prevent the pollution of rivers?—I believe it would be for the benefit of the country.

12,886. What do you do with the night-soil?—It is carted away.

12,887. Does any of it go into the river?—Yes, some of it does.

12,888. Is it difficult to keep it out?—I do not think it would be very difficult, but the principal bulk of it is carted away.

12,889. Do you think you could cart it all away, if that was made the general rule?—Yes.

12,890. (*Mr. Harrison.*) Did you hear what was stated about taxing the county?—Yes.

12,891. Is it not the case that a great part of the West Riding consists of moorland?—Yes.

12,892. I presume that in manufacturing districts the largest ratepayers in the West Riding would be found ?—Unquestionably.

12,893. So that any taxation would fall by comparison lightly upon the agricultural districts ?—Yes. I understand that there is a great extent of moorland in the northern part of the West Riding where there is very little manufacturing.

The witness withdrew.

Mr. JOSIAH LORD (Todmorden) examined.

Mr. J. Lord.

12,894. (*Chairman.*) You have been a machine-maker ?—Yes.

12,895. You are now out of business ?—Yes.

12,896. Where were your workshops situated ?—We commenced up in Walsden, the workshops are now in Canal Street, but I formerly worked for Messrs. Fielden Brothers.

12,897. How long can you recollect the valley of Todmorden ?—I can recollect it very well for the last 45 or probably 50 years.

12,898. Do you think that the river bed has been at all filled up since the commencement of that period ?—Yes; I could not agree with Mr. Joshua Fielden in his statement; I hope he will excuse me. The river is materially filled up, and I have been an observer of it on this account, that I used to be fond of fishing.

12,899. Will you name any of the bridges which have been filled up since you recollect ?—The Grinning Dog Bridge used to be the old highway to Rochdale, but that is, I believe, diverted, and the bed there is, I should say, 12 or 18 inches higher than it was formerly. I went to Messrs. Fielden in 1822.

12,900. What other bridge is there ?—Gandy Bridge, that is on the Burnley Road. I used to live there.

12,901. On what river is it ?—I forget whether it is the Cal or the Der. When they are united they are called the Calder. I know that the Burnley valley is three feet higher at the very least than it was since I first recollect it.

12,902. Did you ever see, since you have resided in Todmorden, anybody throw any solid refuse into this river ?—Yes, many hundreds of tons. I do not agree with Mr. Chambers. I think that all of it ought to be kept out.

12,903. What sort of solid matter have you seen thrown in ?—Ashes, from great boulders to ashes out of the mill, as Mr. Chambers says.

12,904. Did not Mr. Chambers say that he would be quite content that everything should be kept out ?—He did, but he said that ashes did not do so much harm as people think that they do.

12,905. Then there is a difference of opinion between you ?—Exactly.

12,906. But Mr. Chambers said, "I will keep out "all my refuse, if everybody else is made to do the "same" ?—Unless we are all compelled to keep those things out, I think that one has as much right to put them in as another.

12,907. And I suppose that you would not like to be told by either of these upstart people down below that they would make you keep them out ?—I should not much mind it.

12,908. But you would fight against it, would you not ?—I should not myself, perhaps some of these large millowners would. A great amount of matter comes off the hill sides and is washed down into the river during flood time.

12,909. Do you not think that that could be kept out by traps ?—It could be kept out in a better but more expensive way. You might compel people to build a wall on each side of the river, and that would prevent a great amount coming down into the river.

12,910. I suppose that there would be no cost but the labour; there are large quantities of stone there ?—There are large quantities of stone there. There is another thing which has raised the bed of the river more than formerly. Formerly they used to throw the great boulders out of the watercourse excavations, and mend the turnpike road with them; they do not do so now, because they find that that stone does not wear.

12,911. And if they broke it up would it not get down into the river as sand ?—Certainly some part of it would, but that is lighter.

12,912. It would alter its character from boulders to sand ?—Yes.

12,913. Did you ever see any road scrapings poured into the river ?—To a very great extent; they used to pour them all into the river, but now they use them for foundries—for moulding.

12,914. That material answers for that purpose ?—Yes, it is the best thing which they can get. In fact they fetch hundreds of tons down from this road on account of the qualtity of the stone from which it is made.

12,915. What stone is it made from ?—It is from Bearnshaw Tower. It is a very fine grit, called Galliard in this neighbourhood. It is not like the Gannister at Sheffield.

12,916. Did you hear the evidence of Messrs. Fielden ?—Yes, I heard the evidence of both of them.

12,917. As to the amount of pollution which goes into the river ?—Yes; not only is water turned in from the coal-pits, but there is the refuse from the coal-pits, and it comes down here and helps to fill up the brook.

12,918. I suppose that if they have a watercourse near enough they let their bank top wash away ?—Yes, and they get rid of it as soon as they can.

12,919. Do you think that that ought to be stopped ?—Yes.

12,920. Both foul water and every form of solid refuse ?—Yes. If they cannot make use of the solid refuse in any other way, let them take off the sod and cover it over again, and let the land produce two crops of grass, where it now only produces one. It will be an expense certainly, but it will improve the land. There is another cause of the watercourse being filled up, namely, the alterations which the railway company has made. That matter has been spoken to before by other persons.

12,921. If there had been a proper authority to look after the whole river, I assume that that authority would have looked after the railway company ?—Yes

12,922. And it might have been as powerful as the railway company —Yes.

12,923. And have kept them in order ?—Yes, the material all stops at that point called Patmos, the state of which is a very good criterion of the change in the river. The water used to be very deep there, in fact we could catch fish there very nearly at any time we liked, but the water now has very nearly gone away. The petties opposite Patmos or Cobden are over the river.

12,924. Is there anything further which you wish to add ?—The main course of the Crow Carr Ings being flooded at the present time is the bursting of what we call Major Clough, that is a small rivulet which runs at right angles into the river. It is filled up; the millowners have put in some cloughs, and have blocked up the water, and it has washed the embankment away, and it has gone down to the basin at the Crow Carr Ings. That is the reason of that district being flooded so much as it is, in fact it was flooded yesterday morning a second time.

12,925. Any general authority which had power to regulate the river would see that it was not tampered with ?—Yes, and I think that they would see to it in another way; they would turn the stream in at another angle, so that the water would have a greater fall.

12,926. That would do as much good as is done now, and not quite so much harm ?—It would do more good and no harm.

TODMORDEN.

Mr. J. Lord.

19 Nov. 1866.

12,927. (*Mr. Harrison.*) Did you use engine power at your works?—Yes.

12,928. How many boilers had you at work?—When I was in the firm we had two.

12,929. Did you take any steps to prevent smoke when you worked those boilers?—Not then; they have done so since, and I am glad to say that they have accomplished the object.

12,930. How have they accomplished the object?—By Jukes's furnace; it used to be the worst chimney in the neighbourhood, and now it is the best.

12,931. How long has Jukes's furnace been applied?—From two to three months, and it is a perfect cure; you will see no smoke come up at all.

12,932. (*Chairman.*) Do any of the chimnies in this valley smoke at any time?—Yes, very much; the smoke is so thick that you could cut it with a knife.

12,933. If smoke can be prevented by the means which you say have been adopted, do you think that it would be a very great hardship if every person was told that he must work his engines without creating smoke?—My opinion is that it is a benefit and not a loss.

12,934. These people seem to have too much money and so they wash some of it up the chimney?—Yes, to injure other people.

12,935. Is there anything else which you desire to state?—No, except that I wish you would compel all persons to keep refuse out of the watercourse, and to keep the coals in the coal-hole or consume the smoke.

The witness withdrew.

Mr. T. Priestley.

Mr. Thomas Priestley (Todmorden) examined.

12,936. (*Chairman.*) What business do you carry on?—I am a wholesale and retail draper.

12,937. Where are your premises situated?—In Cheapside, Todmorden.

12,938. Are your premises situated near the river?—Yes, just across the road.

12,939. Does the flooding of the river ever injure you, or interfere with you?—It has done so.

12,940. Are you a member of the local board?—No.

12,941. How long do you remember these streams in Todmorden?—18 years; I came here in November 1848.

12,942. Do you think that they have been raised in their beds since you recollect them, by the pouring in of solid refuse?—I think that there has been a gradual rising.

12,943. By solids being thrown in?—Yes.

12,944. Have you suffered any injury in your own business by the flooding of the river?—Yes.

12,945. When?—On the last big flood but one I must have suffered 100*l.* damage. The last big flood was on the 6th September 1861, and the flood to which I allude was in August 1859.

12,946. Do you think that the flooding could have been prevented if the river had been in a proper condition?—I think that if the walls had been strong enough and high enough the flooding would not have occurred.

12,947. Then if some authority had had the power to make the walls strong enough, and high enough, you need not have lost your 100*l.*?—Just so.

12,948. Have you seen any solid refuse at any time thrown into the river?—Yes, hundreds of cartloads—stuff from the road, and everything; in fact the watercourse here is a common receptacle for everything.

12,949. Have you privies or waterclosets on your premises?—Yes.

12,950. Do they drain into the river?—No, they are emptied by hand, and the contents are taken on to the fields.

12,951. Have you heard the evidence which has been previously given?—Yes.

12,952. Do you agree with it generally?—Perfectly so.

12,953. (*Mr. Harrison.*) Have you privies or waterclosets?—They are privies.

12,954. Detached from the house?—Yes.

12,955. What means do you take to deodorize the fæcal matter?—When the box is full it is emptied, and the contents are taken on to the fields.

12,956. Do you use ashes with them?—Occasionally. I have used chloride of lime. I have sprinkled it over.

12,957. Do you use the house ashes?—No.

12,958. Do you find the privy at all a nuisance to your house?—I do not know that we do. There are other dwellings which are nearer than ours, which perhaps may be a little inconvenienced, but I do not know.

12,959. You do not find it any inconvenience yourself?—No.

12,960. How far is it from your house?—Perhaps 10 or 15 yards.

12,961. (*Chairman.*) Is there anything further which you would wish to add?—I do not know that there is. I entirely concur with the remark which Mr. Fielden has made, namely, that I wish that you would take a walk round and see the misery and desolation which has been occasioned by the last flood.

The witness withdrew.

Mr. E. Lord.

Mr. Edward Lord (Todmorden) examined.

12,962. (*Chairman.*) Are you a brother of Mr. Lord who has given evidence?—Yes.

12,963. Did you hear his evidence?—A portion of it.

12,964. Are you in business now?—Yes.

12,965. What amount of coal do you consume in a year?—About 1,500 to 1,800 tons a year.

12,966. What becomes of your ashes?—We have carried them away chiefly on to our own premises, and have raised the low ground about our own premises with them.

12,967. Have you put any in the river?—Never.

12,968. Are you not near enough to the river to do so?—No; in fact we could not put our ashes into the river because we have no right of road to the river.

12,969. If you had been on the river I suppose that you would have let them go there the same as your neighbours?—Most decidedly.

12,970. Have you ever seen any foundation refuse carted into the river?—Certainly.

12,971. A load or two?—Many hundred loads; there is no question of it.

12,972. Do you think that it is necessary for the good government of the river that there should be some new regulations with regard to passing in solids and keeping the banks and walls in order?—I do not attach the importance to it which some other persons do.

12,973. Have you seen the ill effect of the floods of the last week?—Yes, and have felt it.

12,974. To what extent?—I should think from 150*l.* to 200*l.*

12,975. Do you think that it could have been prevented?—Yes, I could have prevented it myself with 10*l.* if I had known beforehand that it was coming.

12,976. Do you think that with this knowledge you could protect yourself now from any future injury?—Yes, so far as the watercourse is concerned, unless a greater flood than this one came. If the bank of the river on the Langfield side had been six inches higher between the houses opposite Mrs. Lord's and Major Gurden's, we should not have had a flooding at all of the land in Langfield.

12,977. You think that that arrangement would have kept the flood off?—I am certain of it, because the flooding has been made simply by the running of the water over the bank and into the field, and the only drain for taking it off is so small that it could only take a very small portion of the water which came over.

12,978. Do you think that the bed of the river has been gradually raised by refuse coming down from the mountains as well as by that which is thrown in?—Yes, by what comes down from the mountains; and I say that the debris thrown into this river is altogether insignificant and has very little to do with the rising of the river bed.

12,979. (*Mr. Harrison.*) You mean in this immediate neighbourhood?—Yes.

12,980. (*Chairman.*) Do you think that it would be practicable to prevent refuse coming down from the mountains into the lower valley?—No.

12,981. Do you not think that rubble walls and cross dams in those mountain rivulets would act as traps and would catch the solids as they rolled down?—I think that they would to some extent, but that they would want more attention than they are worth.

12,982. Do you think that it is more costly to keep that refuse where it is, rather than take it out of the river when it has got in?—No; but my impression is that the river should be made so as to clear out itself.

12,983. Have you no feeling for your neighbours down in the valley below?—Yes.

12,984. Whatever you have suffered they have suffered also, and they have suffered more than you have?—If the same remedy was applied below as that which should be applied here to protect this district it would answer equally well; it only wants carrying forward.

12,985. Lower down to the sea?—That is all.

12,986. Do you not think that it is necessary and cheaper to keep the solids out of the river?—I do not see how you can do it. I think that the remedy is worse than the disease.

12,987. Do you mean keeping out the ashes?—I attach no importance to putting in the ashes, it is so trivial a matter; it is only like a pinch of snuff.

12,988. Then you mean a remedy as regards refuse from the mountain sides?—Yes, that is what I am alluding to. If the river was made sufficiently narrow, and if the foundations of the walls were put in so that the water could never wash the bottom of them, and if the banks were raised and made sufficiently strong, the water would wash its own way.

12,989. (*Mr. Harrison.*) Who do you propose should do that?—I should think that it ought to be a national thing, and that the whole of the country ought to combine and make all rivers which are subject to these things right.

12,990. And keep up the banks?—Yes.

12,991. That would be rather an expensive operation?—I believe that there has been more damage done in this very flood than the interest of the money that would be required for the outlay.

12,992. (*Chairman.*) You refer to what the manufacturers on the river areas have suffered in the last week?—Yes.

12,993. Besides the number of lives which have been lost?—No lives have been lost in this neighbourhood that I am aware of.

12,994. But in a great many of the towns below they have suffered severely in loss of life?—Yes.

12,995. (*Mr. Harrison.*) Have you applied Jukes's apparatus to the boilers?—Yes.

12,996. And with success?—Yes.

12,997. Have you done anything besides applying this patent apparatus?—No; so far as smoke preventing is concerned we use simply Jukes's stove.

12,998. Do you think that there would be any hardship in preventing all people from making smoke?—No; I believe that it would be a benefit to them.

12,999. Do you believe that by that, or by other means, smoke might be prevented?—Yes, I have no doubt of it.

13,000. It would be a great advantage, and would tend to the comfort and the health of the inhabitants of all these towns, if smoke were prevented?—Yes.

The witness withdrew.

Mr. Frederick Rodley (Todmorden) examined.

Mr. F. Rodley.

13,001. (*Chairman.*) What are you?—Surveyor and inspector of nuisances to the local board.

13,002. How long have you been surveyor to the board?—Nearly three years.

13,003. Have you charge of the streets and roads; the scavenging?—The turnpike road is managed by the trustees.

13,004. What length of streets and highways have you under your charge?—We have only about two miles repaired by the local board. The streets are nearly all private streets, repaired by the owners.

13,005. If you scrape your roads, what do you do with the refuse; do you pass it into the river?—No.

13,006. Have you ever thrown in any refuse from the roads?—No, not since I have been here.

13,007. Have you carried out regulations for preventing soil from privies going in?—In some instances.

13,008. But some of it goes in yet?—Yes.

13,009. Have you served people with notices not to do it?—No; it is mostly in the out districts that that is done.

13,010. Have any sewers been made since you have been surveyor to the board?—Yes; only to a small extent; a few sewers in our own roads, but not connected with any system of drainage.

13,011. The board have begun to talk of a system of drainage for the whole place, have they not?—They have been talking of it ever since I have been here.

13,012. But do you think that they are talking of it now more seriously?—We only go slowly in Todmorden.

13,013. Have you any rain gauge here?—Only what Mr. Stansfield has.

13,014. What effect has this flood had upon any part of the town and property, so far as you know?—About 300 dwelling houses have been flooded.

13,015. Have the inhabitants been seriously injured?—Yes; they could not go out of their houses for 24 hours or 48 hours; they had the water 3 feet 6 inches deep, in some instances, in their living rooms.

13,016. Who will be at the cost of cleaning it out?—That will have to be done at the expense of the tenants.

13,017. Was there much sediment—sand and rubbish?—Yes, mud; but no heavy material.

13,018. Do you think that that flood could have been kept out if there had been proper arrangements on the banks?—No.

13,019. You think that the houses are too low?—Yes; they are not fit to live in.

13,020. Before persons can build any houses here they have now to lay a plan before the local board?—Yes.

13,021. And would the local board prevent houses being built in places of that sort?—Yes, we do so now.

13,022. You would consider that that land should be raised before being built upon?—Yes; the local board came 10 years too late as regards Todmorden.

13,023. Who are the landlords who own those houses, are they the owners of the mills?—No, they are small owners.

13,024. Some of them I suppose have suffered themselves?—Just so.

13,025. Have they at all complained to you of the flooding?—No, they never make any complaints of the flooding.

13,026. They think that it is of no use?—Yes; I should recommend the board to buy those houses, or to take them in some way, and to fill the place up.

13,027. Do you think that the bed of the river has been raised, since you have known it, by refuse coming down?—In 1864 I made some observations, and ascertained the depth of the debris in this part of the river. When the railway company diverted this portion, they paved the bottom; it is inverted there, and I ascertained that the minimum depth of accumulated material was about 3 feet 6. I tried it in four or five

TODMORDEN. *Mr. F. Rodley.* 19 Nov. 1866.

different places, and they are in about the same condition now, only that I believe that there will be a considerable deposit from the flood of last Friday.

13,028. Some people say that floods wash the river out. I suppose that you find that that is not so?—No.

13,029. That if the refuse is washed away in one place it is accumulated in another?—Yes, the flood has deposited many tons of stuff upon the Burnley turnpike road.

13,030. The Turnpike Trust will have to remove it?—Yes.

13,031. If that wall had been strong enough, would that have been prevented?—No, the bridges are not strong and big enough. At Gaudy Bridge several things were brought down by the flood, which could not be removed at the time.

13,032. Do you think that some general regulation is wanted for the river for the purpose of keeping the banks in order, and of keeping the bridge ways open? Yes.

13,033. Do you think that it would be a very costly thing to reduce the bed of the river so as to open out the bridge ways?—I think that the bed of the river will constantly rise.

13,034. Except it is kept down?—Yes.

13,035. Do you know Bacup?—A little, not much.

13,036. Have you been there lately?—Yes.

13,037. There is a local board in Bacup?—Yes.

13,038. And they have taken some of the Government money for their sewerage and local improvements?—Yes.

13,039. Have you seen in the papers that they have not suffered very much, and that they attribute that result to their having deepened and cleansed the river, by the money which they obtained from Government?—I have not.

13,040. (*Mr. Harrison.*) Can you give us the death rate in this parish?—No.

13,041. In the new buildings which are erected, do you make any provision as to the ash pits and privies?—Yes.

13,042. What provision do you make?—We require a privy to be provided for every house, or every two houses at most, and each house to have 100 square feet of space.

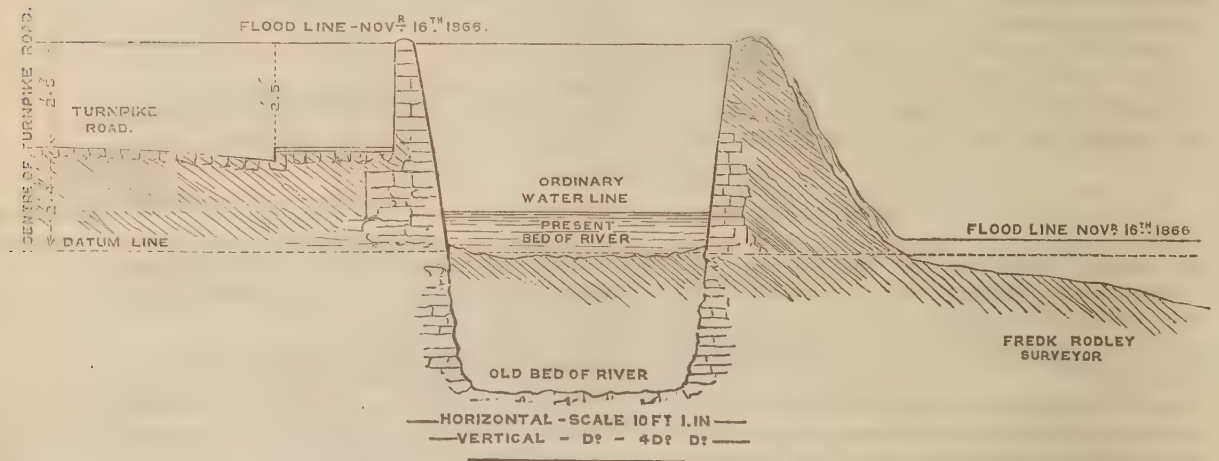
13,043. Do you make any regulation as to the distance at which the privy shall be from the house?—We allow five feet as a clear space between the house and the privy.

13,044. (*Chairman*). You have byelaws?—Yes.

13,045. Can you put those byelaws in?—Yes, they are framed upon the byelaws issued in London from the Local Government Office.

The witness withdrew.

The witness subsequently prepared and forwarded to the Commissioners a Transverse Section of the river Calder, at Burnley Road, Todmorden, taken after the flood of November 16th, 1866:—



Mr. J. B. Bamford.

Mr. James Byrom Bamford (Todmorden) examined.

13,046. (*Chairman.*) What are you?—A surveyor.

13,047. Resident in Todmorden?—Yes.

13,048. In general practice?—In general practice.

13,049. How long have you resided in Todmorden?—12 years.

13,050. In your occupation have you made any levels, or cross sections, having reference to the river?—I have not.

13,051. Have you made any observations with regard to the condition of the river, whether it is rising in its bed, or not?—I think that it is, but I have not levelled it. I have a few statistics which I have kept as to floods.

13,052. Will you put before the Commissioners any remarks or statistics which you have to offer as to flooding?—On the 26th October 1855 there was a flood.

13,053. What height did it rise?—I could not get out of the house at Patmos. Our house was 4 inches deep, but the houses below were 3 or 4 feet deep.

13,054. Did the poor people suffer very much in consequence?—Yes.

13,055. How many houses should you think were flooded?—I should think 40 or 50 at that particular place.

13,056. When was the next flood?—On the 10th August 1856; that was deeper than the former one which I have mentioned.

13,057. How much did it flood your house then?—7 inches.

13,058. And how much did it flood the property below?—3 inches more than before.

13,059. How many houses did it flood then?—About 50. Gandy Bridge burst at that time, and the river wall was washed down opposite the "Shoulder of Mutton" Inn, Toad Carr, and a part of a house at Gauxholme was washed down by the giving way of the arch there.

13,060. Were any lives lost?—No.

13,061. Do you consider that the arches over the river are too small for these excessive floods?—Yes.

13,062. And you think that they should either be deepened or widened?—Yes, I think that they should be deepened.

13,063. When was the next flood?—On the 7th December 1856; that was not very deep; it was only two inches deep in my house, and the river wall was washed away opposite the "Shoulder of Mutton" at Toad Carr.

13,064. Do you think that a stronger wall would have stood?—Yes, it has done so below.

13,065. How much do you think that a wall would have cost them?—I cannot tell.

13,066. Do you know about what money damage there was from that flood?—No, I cannot tell that.

13,067. But there was a considerable damage?—No doubt of it.

13,068. Besides inconvenience?—Yes.

13,069. When was the next flood?—On the 15th August 1857. It was then 9 inches deep in my house.

13,070. That was higher than any of the others?—Yes.

13,071. And of course all the houses were flooded so much higher again?—Yes.

13,072. What was that from?—From the bursting of Pudsey dam and the watercourse wall.

13,073. And the bridges were inadequate again?—Yes.

13,074. When was the next flood?—On the 7th August 1859. That was not from the Burnley valley, but the water was 2 feet 5½ inches deep in the "Golden Lion" Inn.

13,075. And of course it was over all these roads?—Yes.

13,076. Did it damage much property?—Yes; Mr. Chambers and Mr. Priestly both sustained heavy loss. Messrs. Ormerod's mill in Walsden was flooded by the arches lifting the shed floor. The river wall opposite the "White Lion" Inn was washed down, and all Waterloo was flooded.

13,077. How many houses were flooded there?—There was a flood all the way down here. 300 or 400 houses were flooded.

13,078. There was a flood all the way down here, 300 or 400 houses were flooded.

13,079. All of which would suffer more or less?—Yes.

13,080. I suppose that the flooding of these basements would leave the houses miserably damp all the winter?—Yes. The floods are generally in August, and it is May next year before the houses become anything like fit to live in. York Street cellars were flooded on the occasion to which I have just referred, the water was six and seven feet deep in the cellar livings. Mr. Hammerton's cellar was flooded. Hebden Bridge, Mytholmroyd and Bacup were all flooded by that particular flood and generally injury was done to them.

13,081. Have you anything further to state?—On the 6th December 1860 the flood was 12 inches deep in our house.

13,082. And it flooded other properties just the same?—Yes; we kept the water out of the house for a time by boards at the doors, but the pressure of the water outside forced itself up the floor in a number of miniature fountains. The river wall opposite Dr. Cockcroft's house broke down, and that caused the flood. On the 6th September 1861 the "Golden Lion" was 3 feet 8 inches deep in water.

13,083. That is the hotel in which we are stopping?—Yes. The wood yard was flooded.

13,084. And all the houses were affected?—Yes; a wall in a cottage was washed down and there were 5 feet 6 inches of water in the rooms.

13,384*a*. And all the basements were flooded?—Yes.

13,085. And a great deal of injury was done?—Yes. The waterside was flooded. Mr. Chambers' mill in Salford was many feet deep.

13,086. Mr. Chambers at that time suffered injury? Yes. All the Roomfield Lane cellars were flooded, Messrs. Fielden's wood bridges opposite the "White Lion" was damaged; Wadsworth Mill was nearly washed away, and the wall was burst there. Stoneswood Mill was five or six feet deep in water, Walsden Station was flooded, Ingham's Arch at Walsden burst.

13,087. It was blown up?—Yes, and the whole of the gardens on the top of it were swept away. There was no flood in the Burnley Valley at that time.

13,088. When was the next flood?—On the 7th May 1862 we were 12 inches deep with water in the kitchen. Gandy Bridge was lifted, it was blown up.

13,089. What was the next case?—On the 11th of June 1863 Gandy Bridge burst again.

13,090. And was the district flooded?—Yes, we were 12 inches deep in our house. On that day there was a local board meeting, and a deputation composed of Messrs. Shepherd, Mills, and others complained of Major Clough and asked the board to try to do something to prevent floods, and they partly promised.

13,091. What did the board say?—They said that they would see.

13,092. Have they seen yet?—They have not.

The witness withdrew.

Adjourned to Tuesday the 27th instant, at Keighley.

The following letter was forwarded to the Commissioners by Mr. Blackburn, of Brighouse, on the Calder:—

Brighouse, November 30, 1866.

GENTLEMEN,

As it seems somewhat probable you will not hold a sitting at this place, I have to ask you to excuse me writing to you upon the subject of your Commission.

I am the owner of three cotton mills here, driven by steam power, two on the banks of the Calder, whence I draw my necessary water supply. The damage done to me by the recent flood, and in the locality generally, is somewhat serious, and I believe much of it might have been prevented had proper precautionary measures been applied.

Since the flood I have had the river above my mills examined, and at one spot is found a sand bank nearly half way across, which is left bare when the river is low, while directly opposite it and in some other places the water is from six to 12 feet deep. This bank is the accumulation of refuse thrown into and left at the sides of the river by various parties, just because they find it a convenience.

It is clear enough that the existence of these banks is, partially at all events, the cause of the water overflowing in freshes.

I would therefore respectfully suggest that the bed of the river ought, in the first instance, to be cleared of everything it contains, so as to remove every obstruction to the flow of the water, and that inspectors should in future be appointed as "rivers inspectors," who should be under governmental direction, and in no way subject to local influence. These inspectors ought in many cases to have power to compel recent incroachments on rivers to be removed, for in places like this, where mills and trade premises are continually increasing, the becks and streams are frequently invaded for the purpose of obtaining a few yards of land; and to such an extent has this been done on the Clifton beck, that but for such contractions I believe the overflow would have been comparatively small (if any) to that which has just happened.

I am, &c.,

(Signed) THOS. BLACKBURN,
Cotton spinner, &c.,
Brighouse, Yorkshire.

To the Rivers Commissioners,
&c. &c. &c.

Keighley, Tuesday, 27th November 1866.

PRESENT:

ROBERT RAWLINSON, Esq., C.B., IN THE CHAIR.

JOHN THORNHILL HARRISON, Esq. | Professor JOHN THOMAS WAY.

JOSEPH CRAVEN, Esq. (Keighley), examined.

KEIGHLEY.

J. Craven, Esq.

27 Nov. 1866.

13,093. (*Chairman.*) Are you chairman of the local board of this district?—I am, and I have been so from the first, for eleven or twelve years.

13,094. What is the population of Keighley?—Within the district extending a mile from this place I think at present it is about 20,000.

13,095. Has the population grown rapidly recently?—Yes.

13,096. Have manufactories been recently established here?—Yes.

13,097. Of what class?—The original trade was worsted spinning and manufacturing, now the iron trade has been introduced, machine making, machinery for worsted spinning, power looms, washing machines, manufacture of tools, and foundries for castings.

13,098. Do any of those manufactories use water largely for the purposes of their trade?—Some of them do to wash or for scouring the wool.

13,099. Are they situated on becks or tributaries of the river Aire?—Most of them are.

13,100. What becomes of the polluted water?—It runs into the Worth and then into the Aire.

13,101. What do they do with their ashes?—At present they cart them away somewhere. They used to put them into the beck; I daresay nearly every person at one time did so.

13,102. Do any of them do so now?—I believe not. The clerk to the board will tell you that proceedings which the board have taken against millowners and those who have manufactories on the banks of the river stopped them throwing their ashes in.

13,103. You indicted them for it as a local board?—Yes.

13,104. Have you an inspector of nuisances in Keighley?—Yes.

13,105. And a surveyor of highways?—Yes.

13,106. I suppose you instruct the inspector of nuisances to inform you if he finds any persons throwing in any rubbish or ashes?—Yes.

13,107. Have you any power as a local board to improve the streams by deepening the beds or walling the channels?—I am afraid not.

13,108. Have you carried out any system of sewerage in Keighley?—Yes.

13,109. What becomes of the sewage from the sewer's outlet?—Now we have constructed a main drain right through the town, and we are constructing another to take the sewage into the river Aire.

13,110. Are there any waterworks in Keighley?—Yes.

13,111. Belonging to the board?—Yes.

13,112. Where does the water come from?—It rises on the pastures on the west side of the town.

13,113. Have you impounding reservoirs?—Yes.

13,114. Do you know what your works have cost?—The present works have cost about 12,000*l.*

13,115. Was that raised by a loan?—It was borrowed under an Act of Parliament.

13,116. It was not borrowed altogether under the powers of the Local Government Act?—No, the waterworks belonged to a waterworks company, but now they belong to the local board; we purchased them.

13,117. Have you extended them?—We shall apply this session for an Act to extend the waterworks. The local board have not enlarged their works since they purchased them.

13,118. From which of the streams does the water come?—The gathering ground is on the west side of the town; we do not take any water out of any of the natural streams.

13,119. The water is obtained from that gathering ground?—Yes, from springs.

13,120. Have you carried out much house drainage in connexion with the sewerage works?—Yes, a pretty fair quantity.

13,121. Are there many waterclosets in the town?—Not so many.

13,122. This hotel and the better class of houses I suppose have waterclosets?—Yes, there are a few.

13,123. How do the owners of the mills dispose of their refuse?—They have not waterclosets, but they have privies, and the refuse is carted away.

13,124. It does not go into the river?—I think not.

13,125. Then the watercloset refuse will go into the Aire if you complete the sewerage works?—Yes, but the local board have discountenanced waterclosets.

13,126. What do they countenance?—Privies and ashpits.

13,127. Are any of those situated near to the cottages?—Some of them are getting down too near.

13,128. Are they placed underneath bedrooms in some instances?—I do not know that, but no doubt they are nearer than they ought to be.

13,129. Are there many unpaved streets in Keighley?—Yes; the town rose rather rapidly; people bought houses, and since the local board commenced, about 11 years since, we have done a great deal in paving and flagging many streets which had been entirely neglected before.

13,130. You can compel the owners of the land to pave the streets, can you not?—Yes.

13,131. The board have power to borrow money to enable them to do these things at a rate that shall not be oppressive to the present generation?—We have some money belonging to the gasworks, and we have generally lent that for paving purposes, and much has been paid back again.

13,132. Do the gasworks belong to you?—Yes, they do.

13,133. You possess the gasworks and the waterworks?—Yes, and the roads.

13,134. Do you know what amount of debt you have altogether as a local board?—A very small debt. The waterworks were sold to us for 17,000*l.* as a local board; the 6,000*l.* on the gasworks is all the debt there is on the local board.

13,135. Is the income sufficient to meet the interest of the money?—Yes.

13,136. Without a rate in aid?—We have a general rate which is for the roads and the lighting of the town.

13,137. (*Mr. Harrison.*) Has there been much injury done in Keighley by the floods?—Not a great deal I think.

13,138. As a local board, do you take any steps when new buildings are erected as to the position of the ashpits?—Yes, the plans have to be presented to the board and sanctioned before the houses are built.

13,139. Does the board stipulate that the privies shall be at a given distance from the house?—I do not know that exactly.

13,140. Do you take any steps to remedy the condition of those houses that have been built before?—We have not done much in that way; we have it in contemplation to widen and improve some of the streets, and where there is a nuisance we try to remedy it; we have been obliged to buy land and erect privies; a great many houses had none, and so we bought land and erected privies, and then apportioned the expense amongst those parties who used them.

13,141. Do you find that there is much improvement in the health of the people in those parts where the houses are built under your direction?—I do not think that there is much visible alteration in that respect; we have a pretty healthy place.

13,142. What is your death rate?—It is low. We have never had a single case of Asiatic cholera during all the time it has been in England.

13,143. (*Professor Way.*) Your intention, with regard to your future sewerage, is to discharge the sewage into the river?—Yes.

13,144. You have not contemplated any mode of dealing with it otherwise?—Yes; we have contemplated having some places for it to settle in.

13,145. But not to apply it to agriculture?—Yes; I mean a plan by which the sewage should be let to settle, and then the manure should be taken away.

13,146. Have you any knowledge of the methods which have been adopted for applying sewage to land in a liquid form?—No; we think that that matter must be considered at some time or other.

13,147. (*Mr. Harrison.*) How are these ashpits emptied from time to time. Does the local board take any steps to see that they are emptied?—They give notice to parties when they see that the ashpits want emptying, and the parties themselves empty them. I believe they have to pay somebody to take the ashes away; at one time farmers would fetch them.

13,148. Does the refuse from the ashpits find its way into the river or beck?—No; I think it generally gets on to the land.

13,149. The only sewage matter that finds its way into the beck or river is that discharged from the water-closets by your sewerage system?—Yes.

The witness withdrew.

Mr. Isaac Booth (Halifax) examined.

13,150. (*Chairman.*) Are you engineer to the local board of Keighley?—Yes.

13,151. Consulting engineer? — Yes, consulting as well as acting engineer.

13,152. Are you also engineer to the local board of Halifax?—No; but I act occasionally for them.

13,153. How long have you been resident in Keighley?—I am a native of Keighley, but I am not a resident at the present time, nor have I been since 1851, when I went to Halifax, and I have continued to live there.

13,154. How long do you remember Keighley?—30 years and more.

13,155. In what condition were the streams and tributaries to the river Aire when you first knew them as compared with what they are now?—The condition of North Beck particularly, some 30 years ago was very different from what it is now in respect both of purity of water and of the amount of solid refuse placed in the bed.

13,156. Has the bed of that beck been at all raised by solid refuse thrown into it?—It has risen very much within my own recollection; not less than 4 or 5 feet in vertical height.

13,157. What effect has that had on the adjoining land, is the valley a ravine?—Yes, it is; it has had this effect, that all the drains and the sewers emptying themselves into a portion of the North Beck, and some of those emptying themselves into the Worth, have actually become choked up.

13,158. The beck has choked the mouth of the sewers up?—Yes, in several cases the bed of the beck is up to the top of the sewers.

13,159. Is much of that refuse washed down by the floods from the mountains?—No doubt some portion of it comes from the natural operation of the floods; but the greater part of the evil is attributable to placing solid matter in the course of the beck.

13,160. What class of solid refuse has been put in within your knowledge?—Engine ashes (but I do not think it is done now), and foundation material.

13,161. And road scrapings?—Yes; I have seen them placed in the beck many times.

13,162. Where the highways have been adjacent?—Yes.

13,163. Has the beck altered its course by washing its banks away?—No, and for this reason, that its course through the town is circumscribed, by buildings erected on it, and also by the precipitous nature of its banks.

13,164. Has the beck been arched over in any parts of the town by persons for their own purposes?—There is one instance of that kind.

13,165. Is there sufficient waterway under that arch to let the floods pass?—Yes; I believe it has always been equal to discharge the flood water.

13,166. Has there been any injurious flooding in the town recently?—Yes, on the North Beck there is one foot bridge near to Cabbage which has been destroyed.

13,167. But there has been no very serious injury?—Not in the town I believe.

13,168. Did you design the present system of main sewers?—Yes; I did.

13,169. Have any of the outlets of the sewers been impeded by the bed of the river having been raised since you designed them?—No, the system itself is not yet completed. The proposed outlet of the main sewer was directed into the river there (*pointing to a plan*) below that weir. In connexion with this subject the question of dealing with the sewage matter incidentally came up, and negotiations were entered into with the view of erecting at this outlet works, either to filter the sewage, or let it settle, and let the liquid matter pass away.

13,170. Is that land there (*pointing to the plan*), ever underflood from the joint action of the two rivers?—I have seen all this (*pointing to the plan*) covered with water in times of flood, and this road (*pointing to the same*) rendered nearly impassable; that was many years ago, and I believe it has been so recently; but at that time this weir (*pointing to the same*) was in existence, and impeded the free action of the water in the course of the river, and sent the water over its banks. That weir has been taken down in conjunction with other works which have been executed by the Airedale Drainage Commissioners, and the water which formerly remained in the higher parts of the river now passes away without flooding the land here; but it goes down in a large volume, and the consequence is that the land below is flooded.

13,171. Has this new road (*pointing to the plan*) been made?—No, that was a projected road, and negociations were entered into, but they went off on a question of terms.

12,172. What is the sectional diameter of this sewer (*pointing to the plan*)?—4 feet.

13,173. Half of it is in the ground and half out?—Yes; in some places it is half in the ground and in other places entirely. At several points it is totaly buried, and in others there is a little embankment.

13,174. What is the estimate for the entire sewerage as laid out by you?—I think it is about 2,000*l.*

13,175. That would be merely for that outlet sewer?—Yes. It begins from the railway crossing where the new sewer constructed by the Duke of Devonshire is, and ends down at the outlet.

13,176. Where is the existing outlet?—The outlets for the sewage of the town are in various places. There are several, both into the North Beck and into the Worth, but there is a district here (*pointing to the plan*), called Eastwood Row, which has its outlet at exactly the place where the new sewer was designed to have its outlet. But the old drain was mainly an open ditch, and at this point (*pointing to the plan*) there were ponds erected to collect the solid matter, which has been taken out from time to time, and the refuse flowed out by the old drain and found its way down here (*explaining*).

13,177. Has this tributary, the Worth, any considerable rise upon the portion that we see upon this map?—Some.

13,178. I assume that it rises more rapidly than the main stream into which it goes?—Yes; the total

KEIGHLEY.

Mr. I. Booth.

27 Nov. 1866.

rise of the Worth from its junction with the Aire at Stock Bridge to its source, beyond a place called Ponden, on the western side of the boundary between Lancashire and Yorkshire, is 775 feet, and the total length of the stream is 9 miles 1 furlong and 5 chains. The configuration of the country almost suggests that the river Worth and the North Beck should form two separate questions for consideration, inasmuch as the river Worth, above its junction with the North Beck, passes through a district which may be called an agricultural district; there is no town upon it, although there are many mills. Upon the North Beck there is the town of Keighley, and a totally different state of things.

13,179. Do you know the dry weather flow of the river Worth at Keighley?—Not from actual gaugings; but it is tolerably low, and it is impeded by all the weirs upon it, which are in great numbers. Upon the river Worth, from its junction with the river Aire along its whole course, there are about 22 mills.

13,180. What kind of mills are they?—They are mills which are almost exclusively confined to the special business of the locality, worsted manufactories and spinning mills. There is here and there an exceptional case, but not of any moment.

13,181. Do those mills use the water, and more or less pollute it?—Many of them do use water power.

13,182. Do they use the water for washing more or less, and pollute it before passing it back into the stream?—Yes, it is polluted, no doubt, to the extent that it is used. But until the Worth gets down to its junction with the North Beck the amount of that pollution is not so very great, though much worse than I can remember it to have been formerly.

13,183. Do any of those mills use steam power pressure with their water power?—Nearly all of them.

13,184. What do they do with their ashes?—I cannot say exactly. Formerly they used to put their ashes into the river, and latterly upon the North Beck I have seen ashes deposited.

13,185. Have you seen ashes on the North Beck within the town of Keighley?—Yes.

13,186. But the North Beck has nothing like the extent of the Worth?—No, it has not. The North Beck is 2 miles and 7 furlongs in length from its junction with the Worth to a place called Slippery Ford, where the feeders branch out in three or four directions.

13,187. What fall has the North Beck?—The fall from the source of the North Beck to its outlet into the Worth is about 500 feet.

13,188. Have you any tabulated statement as to the mills that you can put in?—No, I have not; but I have the particulars here which I can give you. First as to the Worth: Upon the banks of that stream there are 18 mills between Stockbridge and Ponden, which is the highest point where there is a mill upon the stream.

13,189. What fall is there between those two points?—Between Ponden and Stockbridge there would be about 500 feet.

13,190. Which would be available between those points?—Yes. Besides these 18 mills on the Worth, there are some four others at some distance from the stream, but which drain into the stream, making 22 in all upon the Worth proper. One of the tributaries of that stream is called Sladen Beck; upon it there is one mill or two mills, I am not sure which. Then there is another tributary called Bridgehouse Beck, and there are 17 mills upon it or draining into it, so that in reality the river Worth, above its junction with North Beck, and its tributaries, receive the drainage of 40 mills.

13,191. I suppose you do not know either what power the mills have or what number of hands are employed?—No, I do not.

13,192. Are any of them new mills recently erected?—Yes, there is one or two, but they are mostly old mills. They have become enlarged as the requirements of trade have necessitated enlargement.

13,193. Do you consider that the whole of the stream is so occupied now by mills that any great addition in number is not probable, although enlargement may take place?—No, I do not think so. There is yet an unappropriated fall upon that stream to a considerable extent.

13,194. Upon which additional mills may be erected?—Yes, taking the water power from the Worth. Then the North Beck, from its junction at Keighley to Goose Eye, the highest point where any mill exists, has 13 mills upon it, and upon one of its tributaries, called Newsholme Beck, there are three mills.

13,195. When speaking of mills, I suppose in all cases you mean manufactories, and not corn mills?—Yes; there is one corn mill, but I have not made any distinction.

13,196. It may be as well to distinguish between corn mills and manufacturing mills. I assume that the corn mills are not so liable to pollute streams as manufacturing mills?—Just so; there are 12 manufacturing mills or manufacturing premises and 1 corn mill.

13,197. Are there any corn mills on the river Worth?—Yes; there are two small corn mills. On the Newsholme Beck, a tributary of the North Beck, there are three mills, one is a worsted mill, another is a bobbin mill, and the third is used for some special purpose, for making cotton bands.

13,198. None of those, I suppose, would materially pollute the stream?—No; the bobbin mill would not. There is a change going on there just now; I believe they will make the bobbin mill into a worsted manufacturing mill. There is another mill distant from the stream making a total of 17 upon it.

13,199. What is the number of mills that you have enumerated?—57, on both streams, large and small. Besides those there is a number of iron foundries, the number of which I cannot give you, in the town itself, and there are some which adjoin upon the North Beck particularly, but the others are situated in the town, and about half of them drain either into the North Beck or into the Worth.

13,200. Is any part of the North Beck or of the Worth, as they pass into or through the town, pitched in an invert?—I believe not.

13,201. Some of the streams, I believe, are arched over?—In one case the North Beck is covered over by a spindle manufactory, or a machine shop.

13,202. Do you know what opinion prevails here with regard to the ownership of the bed of the beck or stream, is it that the adjoining owner claims to the centre of the stream?—The custom here differs from that in other places, with the exception of the Aire, where the owner of the land on each side claims to the centre of the stream; in all other streams generally the whole bed belongs to the owner on one side.

13,203. The boundary of an estate in many instances, is defined by a fence on one side of the stream, leaving a strip of land between the line of the stream and the fence?—Yes.

13,204. Is it the law that a ditch always belongs to the field in which it is?—No; that does not prevail generally here. I have known some instances in this neighbourhood where the centre of the fence itself is the actual boundary. I have known other cases where 18 inches from the roots is the boundary, and where 36 and where 40 inches from the roots is the boundary.

13,205. In some places it is the law that a ditch belongs to the field in which it is?—Yes.

13,206. I suppose these becks in some instances follow that law; they are supposed to belong to one side or the other, where they form the boundary of one portion of an estate?—Yes; for instance, here (*pointing to the Ordnance map*) it is so.

13,207. As these streams are continually altering their course, does the boundary remain?—Yes; I imagine what happens is this: the actual boundary between two properties has been fixed to be one side of the stream, then the owner of the land on the opposite

side, in order to make his boundary more definite than before, has erected a fence on the edge of the stream; then in time the stream has altered its course, and so left those little strips of land between the fence and the edge of the stream.

13,208. (*Mr. Harrison.*) How is the ownership decided in case the stream encroaches upon the fence?—I have known several instances of that sort, where an encroachment has taken place, but the bank has been repaired at once.

13,209. And the boundary restored to its old limit?—Yes.

13,210. The stream has been confined to its old limit?—Not much attention has been given to that; where a fence has been knocked down by the stream, the owner has immediately repaired it, and restored his own boundary to its former condition; if he does not do so he loses his land.

13,211. (*Chairman.*) Can you give us any details as to the existing water supply, and what you propose doing for the future?—I can. The present water supply is derived mainly from springs, of which I have here the details.

13,212. What is the subsoil from which the supply is obtained?—This district is in the very heart of the millstone grit. Within the valley there is a very large depth of alluvial deposit, in the shape of gravel, but the subjacent rock is millstone grit, and that is found in the higher portions of the town. Quick sands also exist in the lower portions, and they have occasioned great trouble in the erection of works at times. The present waterworks consist of a reservoir at Calversike Hill, containing 1,550,000 gallons of water. I cannot give you the area or the greatest depth of the embankment. This (*pointing to the map*) is the reservoir which has been made.

13,213. It is a service reservoir, is it not?—Yes; there are several cisterns about the town into which particular springs have been collected from time to time. There is one called the Blind Lane cistern, which is just below this reservoir (*pointing to the map*). There are two cisterns on the other side of the town which are called the Park Wood cisterns; another at a place called Seed Hill; another reservoir near to Castle Mill for the purpose of collecting the water from this stream (*pointing to the same*) and filtering it and bringing it into the cistern at Seed Hill, and also for giving out a direct supply. There is another cistern in Highfield Lane in the north part of the town; and there is a further reservoir, the largest which has been made by the old waterworks company, called the Highfield reservoir. This reservoir (*pointing to the same*) I am proposing to make into a service reservoir for the intended scheme.

13,214. What elevation is that above the ordinary level of Keighley?—About 550 feet above the sea level, and it has at least 250 feet of fall to the centre of the town.

13,215. What number of springs were available to the old waterworks company, or what volume of water daily could they supply?—There has been no specific record kept of the flow of most of those springs, but it was found that they yielded upon one occasion on the 13th June 1856, 61,300 gallons in a day, and on the 6th August 15,360 gallons. There are other springs and streams, the water of which goes into these reservoirs, and the old company appropriated them by sufferance; they were not authorized by their Act; they yield a considerably larger quantity, so that in fact the total daily flow of the springs and streams collected by sufferance is, in winter, 100,260 gallons, and in summer 64,650 gallons; the authorized quantity of the one source is 36,448 gallons, and of the other 12,470 gallons, the mean of which is 24,455 gallons.

13,216. What right have the board to take the larger quantity of 100,260 gallons?—They have taken some of it by agreement, and the rest at will; in point of fact they use it by sufferance; the average flow would be 106,910 gallons a day.

13,217. Did the board know what volume of water they would obtain at the time they purchased these works?—I presume they did, but I do not know that of my own knowledge.

13,218. Do you know what the estimated income was at the time they purchased the works?—I do not.

13,219. What proposed works have you in contemplation to extend this supply?—The proposed works are here (*pointing them out on the map*).

13,220. (*Mr. Harrison.*) The present supply is about five gallons a day per head of the population?—Yes; the works for the increased supply consist of storage reservoirs at a place called Butler Clough, and Slippery Ford, and near to the village of Newsholme. The compensation reservoirs are to be one at Slippery Ford, and the other on the Newsholme stream. This portion of the scheme relating to the valley of the Worth (*pointing to the map*) has been abandoned for the present, the board considering that this (*pointing to the map*) would supply all the wants for the present population.

13,221. Those two (*pointing to the map*) are both abandoned, are they?—Yes.

13,222. What is the subsoil at this point (*pointing to the map*)?—Millstone grit with intervening shales; the ground is remarkably firm, although it varies.

13,223. Standing almost vertically?—Yes.

13,224. What volume of water do you propose to impound and make available under the proposed plans?—I am proposing to bring to the town 500,000 gallons per day, exclusively from the North Beck valley, but when the Newsholme scheme is carried out that will increase that volume to 750,000 gallons per day.

13,225. What compensation do you give for that volume?—The exact amount is not yet determined. We shall go to Parliament next session. I shall calculate the available rainfall of the district, and make proper deductions for evaporation and otherwise, and then bring as near as I can two-thirds of the available rainfall to the town, and give off one-third as compensation to the mill owners.

13,226. What is the rainfall here?—My gauges have been only in since March, but I think the maximum fall is something like 42 inches, and the minimum about 33 or 30 inches.

13,227. What is the acreage that you rely upon for the rainfall?—I have hardly arrived at that yet in consequence of the gaugings not being complete.

13,228. Are no gaugings kept in this district?—No; there has been one, but I find that it is not of a reliable character; a man collects the rainfall into a little pot, and measures it in a very rude way.

13,229. Have not the Canal Company kept any gaugings?—I believe not.

13,230. But the neighbouring towns of Bradford and Halifax keep gaugings?—Yes, at Halifax they do, which is on the southern slope of the hills; we get something like 40 inches.

13,231. What has been the fall during these last wet days which caused the flood?—I do not know, but I believe it to have been $2\frac{3}{4}$ inches in about 30 hours on Thursday and Friday, the 15th and 16th instant.

13,232. Have you ascertained that from gaugings?—Not from gaugings in this district; I have not got the register in.

13,233. What is the estimate for these proposed works?—The estimate, subject to some reservation as to contingencies, is something like 16,500*l.*; but I quite expect that the works will cost 20,000*l.* or 25,000*l.* for 750,000 gallons a day.

13,234. What will be the area of the new reservoir, of the larger one?—About 10 acres; that is the Slippery Ford reservoir.

13,235. What will be the greatest depth of the bank?—63 feet.

13,236. What will be the volume of water impounded?—About 7,000,000 cubic feet.

13,237. That would be about 46,000,000 of gallons?—Yes, or 7,000,000 of cubic feet.

13,238. There are two reservoirs here (*pointing to the map*)?—Yes; this (*pointing to the map*) is the second bank.

KEIGHLEY.

Mr. I. Booth.

27 Nov. 1866.

13,239. The lower one has an area of 10 acres and the upper one about four acres, I believe?—Yes.

13,240. What is the greatest depth of the bank of the smaller one?—48 feet.

13,241. What is its cubical capacity?—About 14,330,000 gallons.

13,242. Are there any other points that you wish to speak to?—Thinking that it might be useful I have taken out the length of these streams with their fall. The river Worth, from its junction with the Aire to its source, is 9 miles 1 furlong and 5 chains in length.

13,243. Is that as the crow flies or measured along the sinuosities of the river?—Yes, measured along the sinuosities of the stream.

13,244. Having a certain number of mills upon it?—Yes, having 40 mills and having a fall of 775 feet, and a draining area of 14,100 statute acres. The North Beck with its tributary, the Newsholme Beck, measured along the sinuosities of the river, is three miles in length, and has a drainage area of 5,100 acres; the number of mills upon it are 17, giving a total drainage area of the river Worth and its trbutaries of 19,200 statute acres.

13,245. Is the area that you have given confined to the North Beck, or does it include the entire area of the two systems of streams?—Yes; it includes the entire area of the two systems of streams.

13,246. Is it not confined to the length you have given?—No, it is not. The drainage area of the Slippery Ford reservoir is 1,874 acres, of which 500 are already appropriated by the millowners' reservoir.

13,247. What is that reservoir called?—It is called the reservoir on Keighley Moor. I call it the mill owners' reservoir; it has not a distinct name.

13,248. The millowners send down a certain volume every day into the stream for their own purposes, I suppose?—Yes, they do. That reservoir has recently been leased by the millowners from the Duke of Devonshire, who, I believe, constructed it, and now it is proposed to appropriate altogether a drainage area of 2,136 acres for the new works, leaving 2,964 acres which we do not interfere with.

13,249. Are you to give compensation out of those 2,964 acres, or provide it out of the remaining 2,136 acres?—We must give it out of the 2,136 acres.

13,250. Do you know what volume of water you are likely to impound upon the 2,136 acres?—I cannot give you that now; the gaugings have only been in existence for a short time, and the weather has been, I believe, very wet, so that it is hardly fair to take the present gaugings.

13,251. Can you safely calculate upon 700,000 gallons a day, plus the compensation?—Yes.

13,252. Out of the storage which you have named to us?—Yes. There is other information which perhaps I may be allowed to give. The total area of the township and parish of Keighley is 10,132 acres 1 rood and 26 perches; the district in which the local board exercises its jurisdiction contains but 1,800 statute acres of that area, leaving 8,332 acres 1 rood and 26 perches as the area of another local board, called the township and parish of Keighley local government board.

13,253. By the proposed scheme is it intended to provide water for both the boards jointly, or for Keighley proper only?—Power is sought to be obtained to supply all these districts below the level of the works with water, together with portions of other districts situated within the parish of Bingley. I would add that the uncultivated ground in this district is about 2,300 acres.

13,254. In the larger area?—Yes, so that there are about 6,032 acres 1 rood and 26 perches of cultivated ground in the township and parish.

13,255. What is the separate population of the two places, and the entire population?—The population of Keighley proper, I understand, is about 20,000.

13,256. What is the outside population?—That is about 3,500.

13,257. Then you have a population of 23,500 to provide for?—Yes, and more than that, because we seek power to provide water to supply a portion of the Bingley district, which is a thickly inhabited part.

13,258. Would you say 30,000 in all?—Yes, about that. It is not very easy to ascertain the population of the towns here. According to the last census, notwithstanding the large increase in the town, the amount of the population has actually been at a standstill.

13,259. You are contemplating, if you take the population at 30,000, and the volume of water at 700,000 gallons, a supply of a little over 23 gallons per head for each person, for domestic and trade purposes?—Yes.

13,260. Independently of the volume that you will give in compensation?—Yes.

13,261. You stated that the bed of the river here had been raised 3 or 4 feet, and you also said you remember that in consequence of the execution of works above, and the removal of a weir, the river Aire below its junction with the Worth was more flooded than it used to be. Has the bed of the river Aire been raised below the junction of the Worth?—Yes; at one point considerable works have been executed by the owners of property to restrain the current within better limits.

13,262. Is that below the junction of the Worth?—Yes; and even there there is an immense accumulation of solid matter now, and the effect, as I said before, has been that the lands below the junction of the Worth down near to Castlefield are very much more flooded than they used to be (I mean compared with the extent to which they used to be flooded). I knew that from observations I have taken as to the extent of those floods.

13,263. Have you observed that there are greater floods arising from the same amount of rainfall?—Yes.

13,264. A flood from a certain amount of rainfall now floods the land below the junction of the Worth more than it used to do?—Yes, I have no doubt of it.

13,265. Does the area of the Worth lie upon the millstone grit?—Yes, entirely.

13,266. Is there any land below the junction of the Worth with the river Aire that would be suitable for the application of the sewage of Keighley?—Assuming that all land is suitable for the application of liquid sewage as manure, there is no doubt of the land referred to being available, only one important difficulty is that the outfall of the sewer is too low to allow of the sewage being so used without pumping.

13,267. There is a considerable fall in the valley of the Aire, is there not?—Yes.

13,268. So that you might soon bring the sewage to the surface?—Yes, by going further down the valley.

13,269. Is there any coal marked in any portion of the area?—Yes, but not in any portion of the drainage area of the Worth, there have been slight attempts made in different portions of the district, particularly above Oxenhope, and some coal workings are carried on there at the present time.

13,270. There are some old coal pits marked on this map, are they old shafts in the millstone grit or through the coal measures?—Through the coal measures in many instances; there is an old coal shaft also there (*pointing to the map*) the millstone grit contains a great number of coal bands.

13,271. Thin worthless bands?—Yes.

13,272. Are those coal pits in the millstone grit in those old thin beds?—They are in the millstone grit. Just at the very edge of the drainage area is the outcrop of the Halifax beds, the lowest in the series; but there is one singular feature in this district (*pointing to the map*) that under the hill forming the northern side of the valley of the Aire there is one of these coal bands which, unlike the others that are seldom more than 9 inches thick, is about 16 or 18 inches in thichness, and that bed has been worked from time to time with interruptions as long as I can remember, but the outcrop of the coal measures proper extends beyond the drainage area.

13,273. Only small thin bands belong to the millstone grit?—Yes.

13,274. (*Professor Way.*) Water for the district is

generally obtained from the millstone grit is it not?—Yes.

13,275. And is termed good soft water I believe?—It is remarkably pure good water.

13,276. Of course it forms the body of the two streams, the North Beck and the Worth?—Yes.

13,277. There is not any large population is there, except the mill population above Keighley?—Yes; there is a large population above Keighley.

13,278. Are there any towns?—Yes, there is the town of Howarth; it is not a large town, but it is a very old town.

13,279. In the absence of mill refuse, would the Worth have been your entire source for a supply of water;—No; except as a last resort, it is so far off; it is at too great a distance.

13,280. At the present time you catch the water in gathering grounds at the upper parts of the district?—Yes.

13,281. If those streams were restored to anything like a moderate state of purity would they be useful for general purposes, apart from drinking purposes?—Yes. I am quite clear about that, and supposing the streams were relieved from the polluted matter which finds its way into them, there is no doubt that the water would be available for other than drinking purposes.

13,282. Supposing you had arranged for a supply of pure water for domestic purposes from a distance, it would still be an advantage to Keighley that the water flowing through it by the North Beck should be of a purer character?—Yes; there is no question about it. The difference in the effect between a pure and an impure stream must be considerable under any circumstances. I can give you the lengths of the other tributaries. Bridgehouse Beck from its junction with the river Worth at Vale Mill to Oxenhope Mill is 1½ miles. The Moorhouse Beck branch of the stream, from Oxenhope Mill to its source at Bodkin Bridge, is 1 mile and 1 furlong. The Leeming water branch of the stream is 1 mile and 1 furlong in length; those are all within the drainage area.

13,283. (*Mr. Harrison.*) Have you examined the river Aire above the junction of the Worth of late years?—Yes, I have.

13,284. Have the works which have been carried out on that part of the river been beneficial to it?—No doubt the land immediately above Kilderwick always used to be flooded with a very small rainfall indeed; it was hardly capable of being profitably used for agricultural purposes, but when a part of those new works were completed things began to change immediately, and that land now is in a very good condition.

13,285. (*Chairman.*) Who were the engineers who constructed those works?—Messrs. Martin and Fenwick of Leeds.

13,286. (*Mr. Harrison.*) You think that the works have been beneficial to the land adjoining, but you believe that they have been injurious to the land below the junction of the Worth?—I am quite clear about that. I attributed the difference in the state of the river below Stockbridge to the fact of the water, which, under the old system, was impounded in the higher parts of the valley, finding its way down more rapidly.

13,287. It floods the land more, it brings down the débris more rapidly, and raises the bed of the river?—Yes; I do not mean that the bed of the river has been raised from that source, but the waters of the river have overflowed its banks more frequently, and to a greater extent than before.

13,288. You would, I suppose, argue from that, that works of that kind should be carried out throughout the whole length of the river?—I am of that opinion most strongly. I find that every day's experience confirms it.

13,289. That would lead to the necessity of placing a river like the Aire under some general control?—Yes; it would.

13,290. (*Chairman.*) You mean that works partially carried out may benefit the individuals carrying them out to the injury of their neighbours below them?—Exactly so.

13,291. I assume you also mean that the filling of any stream by any process, such as throwing in refuse of any kind, may injure the stream not only at that point, but for a considerable distance below, or as far as the floods can carry down the solids?—Yes; that is the actual state of things.

13,292. Has there been a great addition to the mill power upon the streams in this part of Yorkshire since you can remember?—Yes, there has been a very large increase in the power, almost every mill in the district since I can remember has been considerably enlarged, that enlargement carrying with it a corresponding increase in the power employed.

13,293. Is there a considerable amount of pollution passed from Keighley into the Aire?—Yes; some years ago there was a very great amount, but there is not quite so much now.

13,294. From dyewashing I mean, and wool scouring?—There are no dyeworks here of any moment, it would be principally from woolwashing.

The witness withdrew.

William Ferrand, Esq. (St. Ives) further examined.

13,295. (*Chairman.*) You reside near this place?—I reside at St. Ives, a mile from Bingley.

13,296. What distance is Bingley from Keighley? Four miles by the road.

13,297. I believe you wish to add something to the evidence you gave at Leeds?—Yes; first of all I wish to mention that we have had considerable damage done by the late flood, I mean my tenants and myself, on a stream called the Harden Beck.

13,298. Is that a tributary of the river Aire?—Yes; we believe that that damage has been considerably increased by the manner in which the flood water has been let out of the Bradford reservoirs. You will remember that when you were there you advised that a by-wash should be made to the Doe Park reservoir, but no by-wash has been made. I wish to point out to the Commission the system which has been pursued by the men who have the care of those reservoirs. When the reservoir has got full, I am speaking now of the Hewenden reservoir, the water of the overflow rushes rapidly down the by-wash, and it is usual to open the culvert, or to draw the clough, as it is called, and let down a large volume of water, besides that which is running down the by-wash. Some few years ago, they had a heavy flood, and Mr. Anderton, a millowner, who lives in the valley, a short distance below, was standing on the embankment of his mill-dam, and he had scarcely stepped off it before the water that was let out through the culvert came rushing down, swept the embankment of his mill-dam away, and he narrowly escaped with his life. The other day, when the recent flood was rolling along, I looked out of my window, and I saw the Harden Beck flowing over its banks, and washing over the land. A small bridge which I could usually see from my house was completely hidden by the water. In five minutes afterwards I went to the window and I found that the flood had ceased on the land and the bridge was quite perceptible. On examining the beck my impression was that in those five minutes the flood must have settled nearly a foot The consequence of this great volume of water being let out so suddenly is that it washes the embankments away on both sides of the stream; the late flood has done a considerable amount of damage. I am desirous therefore of pointing out to the Commission the system which now exists, because if the reservoirs in that valley were to be increased three-fold or four-fold, which they might be in carrying out this system of supplying water to towns, and if for all was adopted this plan of letting out the water suddenly through culverts, without pro-

KEIGHLEY.

W. Ferrand, Esq.

27 Nov. 1866.

per by-washes to let it flow regularly down, we must have most serious damage done.

13,299. You are probably aware that a bill was prepared last session for the regulation of reservoirs?—Yes.

13,300. For their construction and management?—Yes.

13,301. It was carried through certain stages by the Government, but it was too late in the session to be passed?—I am aware of all the circumstances connected with that bill, but I think it is of the greatest importance that you should see the necessity for some stringent regulations being passed as to these reservoirs, such as I believe are not provided by the measure to which you have referred.

13,302. The evidence which you have now given will in due time come before Parliament. Your opinion at present is that the reservoirs have not sufficient by-wash room provided to allow the water to flow regularly down, and pass evenly away?—Decidedly.

13,303. And that the mischief is added to by opening the cloughs and drawing from the main body of the water at times when there may be a flood?—Exactly so. The overflow through the by-washes rushes down with great impetuosity, carrying away almost the whole quantity of rain water that has fallen at the top of the embankment, at the same time they draw the cloughs up suddenly for a considerable distance, and the volume that thus comes down increases the velocity of the stream below so greatly that the embankment is washed away, and the consequences are most serious.

13,304. If the managers of the reservoir were compelled in each case to provide sufficient by-wash room for the natural discharge of the surface water, they would then never be capable of discharging more than was due to the surface, and such as must necessarily come in the natural state?—That is what I mean.

13,305. You would suggest that Parliament should fix them with the responsibility of providing sufficient by-wash room to take safely away the natural fall of water upon the surface?—Yes.

13,306. Without drawing upon the reservoir at such a time?—Yes.

13,307. And so adding to the volume of the water passing down and destroying property to a great extent below?—Yes.

13,308. If you were to take proceedings against the parties now, you would have great difficulty in establishing your claim for compensation, as the matter would be complicated and your claim would be resisted?—Yes; evidence would be produced on both sides, and that is a kind of action that is better avoided.

13,309. You would prefer that Parliament should lay down certain rules for the management of these matters, so that the landholders should be protected? Yes, such measures as would afford greater security both to land and property.

13,310. Has there been any damage done to the banks of the river Aire and the land on either side by the recent great flood?—On my property damage of the most serious kind has been done.

13,311. To what extent have you suffered damage?—I should say that at one sweep I have had an acre of valuable pasture land washed away entirely.

13,312. Has anything like that occurred to your property from any previous flood?—There was a flood a few years ago, about 1838, when the volume of water which came down this valley was considerably larger than in the recent flood. I know it by measurements taken at houses in Bingley which were then flooded. I cannot at the moment state exactly what the volume was, but I have no hesitation in saying, from my full knowledge of that flood and of the recent one, that the damage done to my property has been ten times greater from this flood than the former one.

13,313. Although in the former flood you think the volume of water was greater?—I know it.

13,314. The recent flood has damaged your property to a greater extent than the greater flood in 1838?—Yes, to a far greater extent. I would account for it in this way—and it is the general opinion of the inhabitants of Bingley who have resided on the banks of the river for many years, and have watched the volocity of the Aire—that on this occasion the velocity of the river was increased to a most extraordinary extent, and it will be so whenever a flood takes place. It is the consequence of the river having been straightened between Skipton and Keighley; it is the consequence of carrying out the Airedale drainage system and cutting the river straight.

13,315. You think that the improvement which has been carried out under the Act of Parliament has tended injuriously to affect your property and the property of others near Bingley?—Yes, most seriously.

13,316. By increasing the velocity of the stream?—Yes, and to an extent that is quite extraordinary to look at. No one would believe it unless he had seen the river before the alterations were made. As soon as the first part of the alteration was completed, I had a strict watch kept on my property, and when the floods came they began to scour out the banks on both sides.

13,317. Do you not believe that the deepening and straightening of the river may have had the effect of benefiting the lands on either side?—Not, I believe, to anything like the extent that was expected.

13,318. But still, I presume, you do not doubt that the lands on either side may have derived some benefit?—I have no doubt of that so long as the flood is within certain limits. For example, they have no flooding, comparatively speaking, between Skipton and Steeton; but in a heavy flood their property is still flooded, although the water runs off with great rapidity. The water is now carried to this point (*pointing to the map*). This is the river Worth (*pointing to the same*), and this valley during the flood was one sheet of water for several days. I may mention that the chief ground upon which the Parliamentary Committee gave their assent to the straightening of the river Aire was the medical evidence that was produced. The witnesses stated that the flooding of the land in the neighbourhood of Skipton, Glusburn, and Kildwick had produced a large amount of typhus fever for many years. They have now, by straightening the river between Steeton Bridge and Stockbridge let the water down to this point just below Keighley, and from Stockbridge to Castlefield, a mile above the town of Bingley. The population here (*pointing to the map*) is four times greater than in the neighbourhood of Skipton, and if typhus fever was produced at Skipton, as stated by the witnesses, it must be produced at Bingley by the floods. You will perceive that Skipton is at the foot of a great range of hills, and there has been an immense quantity of agricultural land drainage carried on in Craven. Nature provided a security for land and property in this valley by all these sinuosities that you see on the map, which checked the rapidity of the river, and this bend (*pointing to the same*) has been a safeguard to the property below Stockbridge. If they cut that through I believe that a bridge over the river Aire could not stand such a flood as we had the other day.

13,319. Is there a bridge there (*pointing to the map*)?—Yes, a county bridge.

13,320. Do you think that will be carried away?—I have no doubt of it, and I believe the riding will have to pay 1,500*l.* if that bridge is washed down. Suppose they cut this through (*pointing to the map*), and a flood comes so much deeper down below Stockbridge, the valley of the Aire will be flooded between Bingley and Keighley. Keighley has a population of 20,000, and Bingley has a population of about 10,000. Suppose they cut this (*pointing to the map*), and let the water down to this point (*describing*), where the river goes through a narrow gorge to the town of Bingley, I have no doubt that the flooding will be increased to the extent of 3 or 4 feet.

13,321. In your opinion, the river should not be tampered with, or dealt with piecemeal?—You have

put a question of great importance, and I say that they had no business to tamper with this river; what they ought to have done was to clear out the bed of the river. Mr. Bateman, an engineer of eminence, was called to prove the necessity or utility of such a step, and was asked this question: "Do you believe that if "they had cleared out the bed of the river it would "have answered equally well towards draining the "valley?" and his answer was, "I have no doubt of "it." Not only this, but the consequence of pursuing the opposite course, viz., straightening the sides has been that the flooding at all times is far greater; in all probability the railway bridge near Apperly would not have been washed away if it had not been for the artificially-increased rapidity of the river. If they let the flood down to this point (*pointing to the map*), through the valley, they will contract the river and send it down to the villages in a far deeper volume and with far greater speed, and they will do an immense deal more damage.

13,322. You desire to call special attention to this case, so that, if any scheme for river improvement should be propounded, the question should be considered as a whole, and the special effect of what has been done here fully inquired into, so that no similar mistake should be made again?—Yes, exactly. I think it is of great importance, now that we have heard what has been the result of straightening this river, that such a step should never be taken again, unless under the authority and with the sanction of some Government inspector, who had inquired previously as to what the probable effects might be.

13,323. In your experience have you ever known of any solid obstructions being thrown into the river or its tributaries near Bingley?—There is a little stream that runs through the village of Harden, and I have noticed during the last two years that the inhabitants have made a practice, which they never did before, of throwing broken pots and all kinds of refuse into this stream; it is only about 4 feet broad, but the other day there was a gardener at work in a garden, and he cut down a large quantity of gooseberry bushes and other refuse, and he threw them into this stream. The consequence was that when the flood came, it washed all this refuse up against an archway, the water flowed back, and must have done between 40*l.* and 50*l.* worth of damage to some beautiful ground belonging to one of my tenants. Now I would suggest that all these streams should be kept perfectly clear from every kind of refuse, and that penalties should be inflicted upon persons who did damage to the property of others, by throwing anything into three streams.

13,324. When such a regulation as that had been established, how would you enforce the payment of the money?—I would have the payment of the penalties enforced by Act of Parliament.

13,325. How would you provide the expenses of the necessary supervision?—That is a question for Parliament to decide, but my own conviction is that every county should bear the burden of its own expenses.

13,326. Would you, as a riparian owner, complain of a rate, regulated by the strictest economy, being levied upon you to carry out the regulations necessary for the drainage of the whole valley of the Aire?—I should have the greatest pleasure in paying my quota, and perhaps I may be allowed to say that it is most gratifying to find that such a good feeling has been exhibited by all the gentlemen who have given evidence before you on this matter.

13,327. I suppose you do not anticipate that Parliament would subsidize Yorkshire in a matter of river purification, or river conservancy?—I do not think that the country generally should be called upon to do it. I think we are wealthy enough here, being all benefited by the trade of the district, to meet any money demands. I do not believe that any person would object to it.

13,328. Supposing that any special improvements were projected, such as those above Keighley, for the particular benefit of particular estates, do you think the money ought to be provided by a general rate, or that the landowners who desire to have the improvements made should exclusively pay for them?—I would make every landowner keep the bed of his own portion of the river perfectly clear.

13,329. Down to a stipulated level?—Yes, it should be kept at a proper level and at a proper depth.

13,330. As fixed and determined by some indifferent person?—Decidedly. I think there ought to be a Government officer employed.

13,331. Independently of local boards?—Yes; entirely independent of local boards.

13,332. Would you have a representative board to manage the conservancy of the river, or would you lodge the authority in some central Government department, as in France?—I should advise that there should be a Government department, and that all complaints should go through the Home Office.

13,333. Would you not contemplate any representation by persons elected from the district?—I doubt whether that would answer. I believe that you would have great difficulty in constituting a board sufficiently independent to act.

13,334. In this country, as you know, we assume that taxation is preceded by representation?—Yes; but I think you cannot have a stronger proof of the correctness of my view than the case of factory inspectors.

13,335. Do you think that they are doing their work advantageously to the public?—I do; and with great satisfaction to the employers and the employed. We scarcely ever have an instance in this neighbourhood of any manufacturer infringing the law; and although there was great doubt at first whether the scheme would answer, I believe it has answered thoroughly well.

13,336. And beneficially for the persons who were controlled?—No doubt of it. The magistrates have the carrying out of the law, and in every case, in these manufacturing districts, we have more magistrates engaged in trade than are connected with land.

13,337. You are of opinion that some machinery, not unlike that prescribed by the Factory Act, would be the best form of river conservancy?—Yes, as far as the inspectors go; but I should wish clauses to be inserted in the Act giving power to the police to lay informations.

13,338. If you bring in the county and borough police, I suppose you would bring in magisterial influence at the same time?—I believe that the magistrates, as a body, do their duty most fairly, and that their decisions are most impartial.

13,339. Do you mean the unpaid magistracy?—Yes. In corporations I should certainly have the borough magistrates, but where there was no corporation I should have the county magistrates.

13,340. Have you heard any discussion as to the propriety of having stipendiary magistrates?—I do not think that stipendiary magistrates would, generally speaking, be the proper persons.

13,341. Are they not found to be necessary for all boroughs?—Yes.

13,342. Do you think that the ordinary magistracy would act better for country districts?—I believe that the public generally have more confidence in the unpaid magistrates than in the stipendiary magistrates, more particularly as the stipendiary magistrates are paid officers as well as the police. The unpaid magistrates are vigilant and careful as to the performance by the police of their duties, and are very careful to perform their own duties properly.

13,343. Have you a seat on the bench here?—Yes.

13,344. Have you any difficulty at any time in forming a proper quorum?—Now and then we have, but very seldom.

13,345. Does it ever happen that there are too many on special occasions; for example, when there is any appointment to make?—We generally find that when there is a valuable appointment to be made at the

KEIGHLEY.

W. Ferrand, Esq.

27 Nov. 1866.

General Quarter Sessions a large number of magistrates attend.

13,346. Whom you have never seen perhaps for a long time before?—They take great interest in the matter. I do not object to it at all. I think that magistrates and public officials take a deep interest in the election of a fit and proper person to fill an important office; the eyes of the public are upon them, and if they do not elect a proper person they lose caste as magistrates and as gentlemen.

13,347. Supposing that any special matters are entrusted to a large body of magistrates and that a select committee first does all the work and then brings it before the general board, does the general board necessarily confirm what has been done, or does not the general board sometimes upset the work of the select committee?—I generally find, in fact I may say that I always find, that the bench of magistrates select a number of their own brother magistrates who are well qualified to perform their duties, and in whom great confidence is placed, and it is very rare indeed that the decision of the committee is set aside by the general body of the magistrates. I scarcely ever knew an instance of a body of magistrates being appointed to inquire into any particular case when they did not most earnestly and zealously perform their duty.

13,348. I suppose you still think that the magistrates as a body would not constitute a proper board for the conservancy of the rivers?—I think that the magistrates would be too much interested in the matter, for you must remember that many of the magistrates are the owners of land on the rivers, and that many of them are largely engaged in trade. I would give every person a right to lay an information and prove a case. I would allow the police to be witnesses because they are a special body of men paid by the public and are constantly on the move; and the injuries are usually done in the night.

13,349. I believe that town councils usually have to carry out smoke clauses?—Yes.

13,350. Are they carried out in Leeds, Bradford, and Halifax?—In Leeds they have made great efforts, and they have been most successful. I understand that the authorities at Bradford are also going to carry out the clauses. I had a conversation with Mr. Salt, of Saltaire, the other day and he was pointing out to me the extraordinary success of his works there; and he also stated that it was an advantage and a saving to every manufacturer to burn his own smoke, that is to say, to burn the smoke with the view of producing heat.

13,351. In other words, to prevent smoke arising?—Yes. I may also mention this fact, that the town of Bingley is under the government of improvement commissioners; several of those commissioners are manufacturers. I have for a number of years suffered from most serious damage done to my woods by the smoke which comes from the chimneys in the neighbourhood. There is a clause in the local Act of Parliament for the improvement of Bingley requiring the smoke to be burned. Some years ago they put other clauses of the Act in force against some farmers who carried manure through the streets, and the farmers complained bitterly that penalties should be inflicted upon them for doing that, when, as they said, there was a clause in the Act compelling these improvement commissioners to burn their smoke, and they did not do it.

13,352. If the county magistrates had had jurisdiction in that case do you think there would have been a better chance of the smoke clauses being enforced?—I have no doubt of it.

13,353. If they could have appointed a smoke inspector selected from the police, and had instructed him to bring cases before the bench do you think the smoke nuisance would have been checked?—I have no doubt that it would; and I may be permitted perhaps to state what you I have no doubt know, that two-thirds of the smoke which is produced in these factories are caused by the neglect of the firemen, and the carelessness with which they throw on the coal. An instance occurred in my own neighbourhood lately of which I made a formal complaint. I find now that the great body of smoke has disappeared, and I can safely say now that very little injury is done.

13,354. (*Mr. Harrison.*) Do you not think that when there is an appointment to be made in the county such as the head of the police, or the governor of a gaol, the magistrates meet together, whether in a smaller or larger number, and take the testimonials which the candidates bring before them, carefully examine them, and exercise the best judgment that they can before they make the appointment?—The course adopted in the West Riding is this: we have a very large body of magistrates, and the testimonials in such cases are generally referred to a committee; the committee then report to the general bench, and my belief is that the magistrates, as a body, are greatly swayed by the decision of that committee. I do not say that there may not be some magistrates who have a personal feeling towards one candidate or another, but generally speaking an election to an office is decided by the names of most of the candidates being withdrawn, and three or four of the best of them being submitted to the bench for selection.

13,355. The object being to try and get the best man?—Yes, and I believe they do that. As to the other question, I believe that if the prevention of river pollution were left in the hands of the magistrates such a large number of the magistrates would be found to be identified with the trade of the riding that such a plan would give less satisfaction than if you had an inspector appointed by the Government.

13,356. You stated, I think, that you would leave those parts of rivers which passed through towns in the hands of the borough magistrates. You are aware that corporations and local boards carry out sewerage works and discharge the sewage frequently into rivers below the towns?—Yes; but I was alluding before more particularly to the refuse of various descriptions that is thrown into rivers.

13,357. Would you leave it in the hands of borough magistrates to remedy the mischiefs resulting from their own acts?—I believe that if you left the matter in the hands of the borough magistrates they would perform their duty; the eyes of the public are upon them, and they are certainly elected to a great extent by popular vote. I will take Leeds and Bradford as examples. I have no doubt that if you left the charge of rivers in the hands of the borough magistrates in those towns you would find that they would enforce the law; they might reduce the amount of the penalties, but they would strictly enforce the law; if not the public press of this country would compel them.

13,358. (*Professor Way.*) The general tendency of your evidence I think, is this, that a systematic management of rivers is a necessity?—I think that we have got to that state of things in this district, that unless something is done to stop the present state of things some frightful plague will break out, either in Yorkshire or in Lancashire, which will sweep off a large part of the population, and the time has come in my belief when the matter can be trifled with no longer. I do not believe there is a single gentleman connected with trade in this district who does not see the absolute necessity for some interference.

13,359. But each is powerless to move as an individual?—Decidedly, and for this reason: Suppose there are a dozen manufacturers on a stream, and 11 of them are anxious and willing to stop all these nuisances; but the 12th says, "I will not trouble myself about the matter, I have used this stream so long that I will not do anything." The consequence of that is, that the 11 men say, "It will be of no use our stopping it our neighbour will still go on and do as before, therefore, whatever we do will be no advantage, we shall only be put to considerable expense"?—I believe that the system can never be stopped by voluntary means.

13,360. (*Chairman.*) The one obstinate man says, "I have abused the stream so far, and I will continue to do it"?—Yes; I know instances; a man insists and will do it; he says that he has got his right, and his right he will maintain.

13,361. A large mill owner may say, "I have always thrown my ashes into the stream," and the question is, "Have you not been complained of by the people below?" "Yes," he says, "but we will not be stopped "by them; but supposing a law to prevent it is made "general, we will then stop it immediately"?—No doubt I think that many men who are now not inclined to yield would, if they saw that all men were restrained by law, say, it is as fair for one as for the other, and now we will stop. The truth is that people do not like to be interfered with by private individuals, whereas if there was a general law, I have no doubt that they would willingly succumb to it like loyal men.

13,362. (*Professor Way.*) And not only so, but they would be anxious to get such a law?—My belief is this, that not only land, but mills and property belonging to manufacturers, would be greatly increased in value, if the streams were kept reasonably pure. Nobody wishes to do anything to stop trade, but I believe that I am within the mark when I say that nine-tenths of the fouling of the rivers now of one kind and another might be stopped without injury to trade, and that the improvement in the condition of the water would be most valuable to the parties concerned. New works would then be erected, and an immense amount of capital would be introduced into trade, which would give increased employment to the population, and increased wealth to the neighbourhood.

13,363. (*Chairman.*) Has there been any increase in the agricultural value of land within the last 30 years to your knowledge?—Yes, very large in the immediate neighbourhood.

13,364. That, I suppose, has followed the increase of population?—No doubt of it.

13,365. With increased population you get an increased value given to land, especially near to towns?—Yes; I do not think that farms have increased in value in the last few years like land in the neighbourhood of towns for building purposes. The rates are heavy in manufacturing districts, and if there should happen to be a depression of trade, they spring up from 2*s.* to 4*s.* 6*d.* in the pound for poor's rates.

13,366. (*Professor Way.*) Has meadow land become more valuable?—In the last 30 years all land has increased in value, but not in the same proportion. You would not get a larger rental for a farm in this neighbourhood than in the Midland counties.

13,367. What is the value of land in this district?—It depends upon the locality. We have cold clay lands upon the high hills, which only produce small crops; it is very expensive to get tillage to them, and that is one reason why the sewage system would improve the value of the land in these manufacturing districts; the manure would be led from sewage tanks on to the hills at a moderate charge and it would pay the farmers.

13,368. I suppose that if judicious arrangements were made for the regulation of rivers all parties might be benefited?—No doubt of it, and the health of the neighbourhood would be greatly improved.

13,369. If you improve the health of the people and add to the wealth of the district you will of course have a fair return for any money that may be expended?—Yes, and I believe that people will pay their money cheerfully.

The witness withdrew.

Mr. William Burr (Keighley) examined.

13,370. (*Chairman.*) You are clerk to the Keighley board of health?—Yes.

13,371. What is your profession?—I am a solicitor.

13,372. How long have you known Keighley?—Intimately since the year 1847. I have known it from 1837.

13,373. Have you prepared any statistics as to the growth of the district within any given period?—I have not.

13,374. When did you put in force the Public Health Act?—In 1855.

13,375. Did you adopt that act after an investigation had taken place?—Yes.

13,376. By whom was the inquiry made?—By Mr. Ranger.

13,377. Was the act put in force under a provisional order?—Yes, and it was confirmed by Act of Parliament.

13,378. How many members do you elect to sit on the board?—21.

13,379. Do you remember what the population was at that time?—Perhaps about 15,000.

13,380. What is it now?—About 20,000, perhaps not so much.

13,381. Was there much opposition to the adoption of the Local Government Act?—No.

13,382. Have you made any purchases of property since the adoption of that Act for gasworks, waterworks, or markets?—We have bought property for gasworks and we have bought the waterworks, or we have contracted for the purchase of them. We have obtained a site for a town hall, but we have not gone on with it; the market we have not interfered with.

13,383. You have a local market?—Yes, but it is in the hands of the company who hold it as lessees under the Duke of Devonshire.

13,384. Is the Duke of Devonshire lord of the manor?—Yes.

13,385. Does he receive market tolls?—The lessees do.

13,386. Would he not accept the local board as lessees of the market?—Yes, at the expiration of the lease.

13,387. What length of time has it to run?—65 years.

13,388. Can you put in a copy of your byelaws?—I will do so.

13,389. And also if you please a copy of the Keighley Improvement Act?—It shall be put in.

13,390. Is it the intention of the board to apply for any additional powers?—Yes. They are applying to extend their gas supply and their waterworks, and also for additional powers and provisions for the improvement of the town; also to prevent the pollution of the river Worth and the North Beck.

13,391. You will have, in fact, I suppose an Improvement Bill before Parliament?—Yes.

13,392. Have you served the necessary notices?—Yes; we expect to deposit our plans on the 30th.

13,393. If you will put in a copy of your bill we shall then see what all the projected improvements are?—Yes, I will put it in.

13,394. What is the amount of your present debt?—We succeeded the old commissioners under the Improvement Act, a copy of which I will hand in.

13,395. How many commissioners were there?—A great many.

13,396. Were they qualified according to rateable value?—No, they were named in the Act of Parliament.

13,397. How long did they continue in office, or were they re-elected?—I fancy they were self-elected.

13,398. Then it was an in and in election?—Yes.

13,399. Did they hand their debt over to you?—The only debt was the debt connected with the gasworks and it was a very beneficial debt.

13,400. The old commissioners had arranged to make gas for the town?—Yes.

13,401. And they handed over to you the works and their debt?—Yes, and very beneficial it was to the town.

KEIGHLEY.

Mr. W. Burr.

27 Nov. 1866.

13,402. Did many of the old commissioners get elected as members of the local board?—Some of them, but not many; three or four at the first election.

13,403. There was nothing to prevent them being so elected?—No; I believe that those who became candidates were elected.

13,404. You have said that it is your intention to extend the gasworks?—We intend to extend the gas supply. The proposed extension of the gasworks will be on the same site.

13,405. Do you also intend to extend the supply from your waterworks?—Yes, we must necessarily extend the waterworks.

13,406. Do you expect that the works when they are established will be self supporting?—Ultimately they will be.

13,407. Do you contemplate levying a rate in aid to begin with?—That will depend upon circumstances. Supposing that we are compelled by Parliament to complete at once all the works which may be necessary, we shall be obliged to resort to a rate, but if they will allow us to take the works as we want them, we think that they will be self-supporting.

13,408. You must define clearly and completely what scheme you require?—Yes, our scheme is defined, the North Beck scheme is understood and defined. If Parliament will give us a number of years to carry that out instead of the usual three years, then it will be probably not necessary to have a rate.

13,409. Do you anticipate any income from the sale of water for manufacturing purposes?—Yes.

13,410. Do you know the volume that is contemplated to be brought in?—No.

13,411. Did you hear the engineer who was examined say that 23 gallons per head were the volume he contemplated for trade purposes and domestic purposes?—Yes.

13,412. Do you sell any of your water now for trade purposes?—I believe it may be sold to one or two parties but such sale is against the provision in the present Act; it is done illegally.

13,413. Have you discussed at your board the propriety of carrying out a more complete system of sewerage?—Yes, many times.

13,414. Have you discussed the propriety of draining, paving, and channelling the new streets which have been made?—Yes, and a great many new streets have been drained, paved, and channelled.

13,415. Are there some now that have not been so treated?—Yes.

13,416. If you drain, pave, channel, and sewer, you will add necessarily to the amount of the sewage which will find its way into the river?—Yes.

13,417. Have you discussed the probability of your being allowed continuously to pass the sewage into the river Aire?—Yes.

13,418. Do you think that you will be allowed to do so?—I think that we shall not.

13,419. Have you at all considered what you are to do with the sewage if it is not allowed to be passed into the river Aire as now?—There was a scheme for making reservoirs for filtering in order to prevent all foul deposit from going into the Aire.

13,420. May we assume that your board have anticipated that some provision must be made for disposing of the sewage otherwise than by passing it into the Aire?—They have anticipated that.

13,421. May we assume that when the time comes they will fairly and honesty discuss the question and do the best they can?—Yes.

13,422. They will endeavour to comply with any moderate law that may be enacted?—Yes, I have seen no signs otherwise. I was the first clerk elected after the constitution of the board of health in 1855, and I believe that the board would do everything they could to obey the law as soon as they knew what the law was.

13,423. Do any manufacturers in conducting their own special business of washing or dyeing to your knowledge pollute the streams by putting their refuse water in?—Yes, they pollute the water.

13,424. Do any of them pass ashes or other solid refuse into the river?—Yes.

13,425. Have you as a local board any power to stop that practice?—Not as a local board but as improvement commissioners we have powers under the Act.

13,426. Do you retain in your provisional order the powers which were exercised under the Improvement Act along with the Public Health Act?—Yes, some of them; some have been repealed. The 75th section of the 5th of George the IV., chapter 23, called the Keighley Improvement Act, enumerates a whole host of offences to which you may wish to refer.

13,427. Have you read that Act so as to understand it?—Yes, I think so.

13,428. Do you consider as a lawyer that it will hold water?—No; besides we have had a decision of the Court of Queen's Bench against us.

13,429. For attempting to act upon that clause?—Yes; it was decided that we had not the power, although it had been assumed that we had.

13,430. Have you had occasion to test the legal applicability of that clause 75, have you attempted to apply it?—I will explain the matter if you please in my own way. Soon after the constitution of the local board complaints were made by several members of it of the state of the North Beck and the river Worth. At that time I was consulted as to what powers the local board possessed to prevent pollution in the way complained of, and I gave it as my opinion then that the powers which we possessed were defective and that it would be quite futile to attempt to carry them out, and also expensive. Things went on in that way from 1855 to 1864, and in 1864 an opinion was produced that had been given by the late Mr. Robert Hall, who was a very sound lawyer, a member of the northern circuit, and recorder of Hull. His opinion was that we had power to prohibit the pollution, or rather the obstruction, caused by ashes and other things being deposited in the beck, inasmuch as the North Beck might be proved to be a common sewer. The board, knowing that that was the opinion which had been given by Mr. Robert Hall, directed me to apply to Sir George Grey, which I did through "The Local Improvement Act Office," and the answer that was received from Mr. Tom Taylor was that the Act was sufficient to prevent that pollution. Upon that the board directed a prosecution at the very first opportunity of one of the manufacturers who had been detected in polluting the river. But before that, and immediately on their receiving the letter from Mr. Tom Taylor, the board issued the following placard, which I will read, "Keighley Local Board of Health. "Notice to persons throwing or depositing ashes in, "or otherwise stopping up or impeding the passage of "any common sewer, ditch, or watercourse, within "the limits of the district of the said local board of "health. Whereas under and by virtue of an Act of "Parliament, made and passed in the fifth session of "Parliament of His late Majesty King George the "4th intituled, 'An Act for paving, lighting, cleans-"'ing, watching, regulating, and otherwise improving "'the town of Keighley, within the parish of Keighley, "'in the West Riding of the county of York,' certain "powers are vested in the above-mentioned local "board, as successors to the Commissioners appointed "by and in pursuance of the said Act, for the im-"provement of the said town of Keighley, in the 75th "section of which said Act it is more especially men-"tioned that 'if any person shall for the purpose of "'collecting manure or for any other purpose stop up "'or impede the passage of any common sewer, ditch, "'or watercourse, every person so offending shall for "'each and every such offence forfeit and pay any "'sum not exceeding 5*l.*; and it shall be lawful for "'any officer appointed by virtue of the said Act, or "'for any constable or peace officer, to take away and "'remove any of the before-mentioned obstructions, "'in case the party occasioning the same shall not "'remove the same within a reasonable time after "'being required so to do by any person or persons "'whomsoever; and it shall be lawful for any con-

" ' stable or other peace officer, or any one of the said " ' Commissioners, or any officer or other person acting " ' by or under their authority, by virtue of the said " ' Act, and without any warrant whatsoever, to seize " ' and apprehend any such offender or offenders as afore- " ' said, and forthwith to convey him, her, or them before " ' some justice or justices of the peace for the said " ' Riding in order to his, her, or their conviction of such " ' offence ; ' and whereas certain persons have, con- " trary to the provisions of the said Act therein-before " set forth, from time to time contravened the same by " placing or depositing ashes, rubbish, and other ob- " structions in the common sewers, ditches, and water- " courses, within the district of the said local board, " and more particularly in the beds of the North Beck " and river Worth, both within the board's district, so " that the same have now, in consequence of such prac- " tice, become a great nuisance and injurious to the " health of the inhabitants and ratepayers within the " said district ; Now, therefore, notice is hereby given, " that the above-mentioned local board of health " have determined to put in force the provisions of the " said Act herein-before set forth, and all other powers " and authorities vested in them by the said Act, or by " any other Act or Acts of Parliament whatsoever, " and to enforce the penalties against parties contra- " vening the said provisions; and that all future " offenders will be prosecuted as the law directs.—By " order, William Burr, law clerk. Keighley, 12th " October 1864." That placard was to caution the manufacturers and others from depositing their ashes in the becks, but, as I have stated before, one of the manufacturers was afterwards detected in throwing ashes in the usual way into the North Beck. The local board was then driven to this necessity: They must either test the correctness of Mr. Robert Hall's opinion by an indictment at the Quarter Sessions, or by some cheaper proceeding, or let the matter fall through On consideration it was thought better to summon the offending party before the magistrates and get the evidence in there and then ask the magistrates to grant a case for the Court of Queen's Bench in order that we might have a decision as effectually and as cheaply as possible. I may say that our board take very great care of their money. The matter came before the magistrates, and the magistrates decided against the board, on the ground that the North Beck was not a common sewer. The case was then taken before the Court of Queen's Bench, and the other day it was decided against the board; it is reported in the "Leeds Mercury."

13,431. Of what date?—Thursday, November 26th.

13,432. On what day was the decision given?—The day previously; the whole case will be found in the report of the law proceedings on that day. We apprehend that this decision is a very valuable one to us just now, as we are making application for new powers under a new Improvement Bill, as we might have been answered and told that we had already power to prevent pollution, and if so it might have been difficult to get new powers, but when we have this decision pronounced in the highest Common Law Court of the country that we have not these powers, we think that there will be no difficulty in getting new powers to prevent the excessive pollution of these two waters, the North Beck and the river Worth.

13,433. I suppose if you obtain such powers as you are seeking to get you will have no jurisdiction beyond your own boundary?—Unfortunately not.

13,434. The rivers might be polluted above the town to the same extent as they are now polluted by parties below the town?—Yes, they might be.

13,435. Therefore, the new powers that you are seeking will be effective only within your own district?—Exactly so.

13,436. If it became a matter of expense to keep the beck clean, manufacturers within your district would labour under a disadvantage as compared with others who were outside?—Undoubtedly.

13,437. (*Mr. Harrison.*) That leads to the necessity for a more general Act than the mere local one for which you mean to apply?—It shows that there is a necessity for a more general Act.

13,438. (*Professor Way.*) Is not that likely to be the answer which will be made to you in the Committee of Parliament, namely, that you had better wait for a general Act?—We have appealed for this power, and the highest common law tribunal in the land say that we do not possess the power which the words seem to give us; of course, we cannot exercise power which we do not possess.

13,439. (*Chairman.*) Supposing that you possessed the powers which you seek within your own district, is it your opinion, as law adviser to the board, that you could do a great amount of good irrespective of any powers beyond your district?—No doubt of it.

13,440. You could do good to your district and not seriously, if at all, injure the manufacturers?—I do not see how we should injure them. A great many manufacturers have voluntarily given up the practice of throwing ashes into the beck.

13,441. Are there many manufacturers upon your local board?—There are some.

13,442. A manufacturer, if elected, may serve upon the board?—Yes.

13,443. We shall see the clauses which you propose when we see your bill?—Yes.

13,444. Who are your Parliamentary agents?—Messrs. Sharpe, Parker, and Jackson of 41, Bedford Row.

13,445. Then we can get a copy of the bill from them?—Yes.

13,446. (*Professor Way.*) Do the powers which you seek refer solely to ashes and such solid matter, or to the refuse of wool scouring, for instance, and dyeing?—They go to pollution generally.

13,447. Suppose that you were to put your own people under an embargo with regard to the pollution of the rivers, whilst the outside manufacturers were left unrestrained, would not that injure your people, and therefore make it more difficult for them to comply with any law?—I do not think that it would much.

13,448. One of the advantages derived from a law compelling each manufacturer to do his part towards the purification of the stream is that each has good water coming down to him free from impurities caused by other parties situated above him on the stream?—Yes.

13,449. But if you stop short at some limit your manufacturers will not have the benefit of the clean water, whereas they will have the disadvantage of having to clean their own water, is not that so?—To a very great extent.

13,450. Would not that increase the difficulty of legislating and dealing with the question, would it not have a tendency to make your manufacturers discontented with the measure?—The view which I, and I think the majority of the board take, is this: that throwing in ashes is really not necessary, and does not benefit manufacturers at all, and that with the exception of the expense of a few shillings for leading them away, they would not be damaged at all by a law forbidding ashes to be cast into running streams, they can use ashes elsewhere if they think proper. But if we were to carry out a stringent power as to liquid refuse, and to say, "You shall not foul the water at all," we might do manufacturers a serious injury, and a trading district does not wish to injure trade, it lives upon trade, and would not attempt to do anything of the kind; it seems enough to say, "Do not make the thing worse than is necessary." I hope that there will be a general measure.

13,451. (*Chairman.*) Has the town been at all damaged by floods within your knowledge?—Some little damage has been done during the last flood. I am not aware of any previous flood, but there are people who have lived in Keighley for all their lives, the surveyor and others, who will be able to speak upon that point.

The witness withdrew.

KEIGHLEY.

Mr. G. Dryden.

27 Nov. 1866.

Mr. George Dryden (Bingley) examined.

13,452. (*Chairman.*) You are one of the improvement Commissioners of Bingley ?—I am.

13,453. How far is Bingley situated from this place ?—About four miles.

13,454. What is its population ?—There are about 6,000 inhabitants in the town itself, about 10,000 taking the parish.

13,455. Over what area have you jurisdiction as Imperial Commissioners ?—I could not state the number of acres, it would be about half a mile each way.

13,456. How long have you been a member of that Commission ?—About three or four years.

13,457. Is it a Commission acting under a Local Act ?—Yes.

13,458. How many Commissioners are there ?—About 30.

13,459. Do they qualify ?—Yes ; by rating and by property.

13,460. Are they elected by the ratepayers ?—They are not elected by the ratepayers, they are appointed by the Commissioners.

13,461. Then it is a self-elected and self-electing body ?—It is.

13,462. How long has it been in existence ?—About 12 or 15 years.

13,463. Does any stream flow down into and through Bingley ?—Yes, the river Aire flows through Bingley, down the west side of it.

13,464. Is there a beck called Harden Beck ?—There is.

13,465. Have the recent floods had any effect upon property in that district ?—Decidedly, a considerable effect. They have destroyed the banks very much and have flooded the fields and they have done injury in very many ways.

13,466. Are there many manufactories above Bingley on the stream ?—On the Harden Beck there are several.

13,467. Have those streams, or has the river at that point, been at all impeded by solids being thrown in ?—Decidedly so ; very much so.

13,468. And have the beds been raised ?—I have no doubt of it.

13,469. What kinds of solids have been thrown in ?—All sorts of things which you can fancy as being used by cottagers ; everything seems to go in. I am now speaking more particularly of the Harden Beck ; almost everything which has to be thrown out of the cottages is thrown into the beck.

13,470. Is the village of Bingley sewered ?—It is.

13,471. Where do the sewers empty themselves ?—They empty themselves chiefly into the river Aire.

13,472. Is there any water supply ?—There is a good water supply.

13,473. How is water supplied ?—By springs in the immediate neighbourhood.

13,474. The inhabitants get their water from wells and springs ?—They get their drinking water from springs exclusively. It is carried by pipes to a reservoir and thence immediately into the town and it is distributed into the houses.

13,475. Are there many waterclosets in use in Bingley ?—Not a great many, they are exceptional.

13,476. Do such waterclosets as there are drain into the beck ?—Generally speaking they drain into reservoirs.

13,477. Into dumb wells ?—Yes.

13,478. And the liquid overflows or soaks away into the subsoil ?—Yes.

13,479. In what condition do you find the water of the river as it flows down through Bingley, is it bright coloured or is it foul ?—There are no mills above us except a flour mill. A large shoddy mill up to February last was occupied by a gentleman of the name of Worms, and the refuse water which came from it was exceedingly adulterating to the river. I have sometimes seen the river almost as dark as the water of the beck. The river passes at the foot of a garden which I occupy and I have seen the water almost as black as soot.

13,480. Is the beck fouled as well ?—Yes, the Harden Beck.

13,481. By what is it fouled ?—It is fouled by the water which comes from the mills above and also by whatever is thrown in. At Harden Beck the cottages are almost level with the beck, one side of the cottages forms the boundary of the beck.

13,482. The beck washes the walls ?—Yes. I think that there is a little improvement at present but up to almost this period whatever was to be thrown out, the refuse of their washing and so on, found its way into the beck.

13,483. What has been the state of health in those cottages ?—I should wish particularly to allude to that. This year the rainfall has been very considerable and the temperature of the atmosphere has been very low, and consequently they have passed this summer with comparatively little typhoid fever, but last year and for a succession of years before that, and always when the summer has been very warm and the sun has been powerful, there has been an immense deal of typhoid fever in those cottages. There may be 40 inhabitants in those houses and last year I should think that not less than 20 had typhoid fever.

13,484. When they are suffering from fever how are they supported, can they support themselves or has the parish to support them ?—They are, generally speaking, supported by the parish. My partner is the surgeon to the Poor Law Guardians and consequently he sees a great deal of those cottagers, and from time to time I have seen a great deal of them. Generally speaking, when fever breaks out amongst them they are obliged to apply to the parish for relief.

13,485. Then, if the fever is caused by any malarrangements of their houses, or impurities in the stream which could be removed by the parish, the parish is now paying for the disease ?—Decidedly.

13,486. Do you think that the parish might spend its money in preventing the disease ?—The money would be spent a great deal better by having the beck in a proper state.

13,487. And by preventing this pollution ?—Yes. Last year the amount of disease prevailing in that immediate locality was so considerable that I made a representation to the chairman of the board of health, and the result was that the proprietor of the cottages was summoned before the magistrates, and he promised that the sanitary arrangements of the cottages should be considerably improved. I believe that they have been to some extent improved. But that inquiry had reference more particularly to the state of the inhabitants, the want of ventilation in the cottages, and the want of cleansing the privies there, and had no reference whatever to the state of the beck, because that did not at all come under the cognizance of the magistrates, or of the parties who were giving evidence. At the same time I simply wish to say that this great amount of disease which has prevailed so much for a succession of years was not altogether from the internal condition of the cottages, but was partly from the quantity of water emptied from the mills above. When the water is low soapwashings and the refuse from mills are brought down, and the stream not being very quick, they are left by the side of the stream, and part of the bank is left high and dry. In warm weather, when the sun is hot, fermentation arises, and there are emanations of several gases—sulphuretted hydrogen, and sulphuretted carbon, &c.—in short, a poisonous state of things. I have seen that form of disease at Harden Beck so intense that in 48 hours the poison has carried off a man.

13,488. Have you anything like the same amount of disease in the other part of the town ?—No.

13,489. Then, do you connect the dirt and the disease together as cause and effect ?—I do.

13,490. As Improvement Commissioners have you

any power to remedy that state of things?—No, because that is beyond our boundary.

13,491. (*Mr. Harrison.*) Within your own boundary do you take steps to prevent nuisances of the sort?—We have a surveyor of nuisances, and he is constantly taking steps in order to bring about a better sanitary state of things. For instance, for a succession of years privies have been built over residences, and residences over privies; notices have been given with regard to those privies, and they are about to be entirely removed, they are not allowed to be continued any longer.

13,492. How are they cleaned out from time to time?—They are cleaned out at a certain time appointed in the evening or before a certain time in the morning; the contents have to be carted away under the direction of the Improvement Commissioners; they are not allowed to be taken away in mid-day.

13,493. And your inspector looks to it to see that they are cleaned out from time to time?—Yes, care is taken, and from time to time there is an inspection by the Improvement Commissioners to see that the deposits of night-soil are clear.

13,494. Is that soil taken into the country and put upon land?—It is taken into the country, generally by farmers who put it on to their land in the outer districts.

13,495. Have you found beneficial effects to result from this system of inspection and constant cleansing?—Decidedly, there is no question about it.

13,496. (*Professor Way.*) You have spoken of the refuse matter coming down from the mills, and when the water is low attaching to the sides of the stream?—Yes.

13,497. That is principally soapsuds?—Soap-washings and all those materials.

13,498. Is there any dyeing produce?—I think not. The mill which I spoke of was a shoddy mill for separating the cotton from the woollen in order to make use of the wool.

13,499. That was an exceptional kind of mill?—Yes.

13,500. Do you know at all what other source of pollution there is from these mills which you speak of besides soapsuds?—No. So far as I know almost everything is thrown into the becks. Unfortunately manufacturers have been in the habit of polluting the becks, and consequently their tenants and cottagers seem to have no objection to follow the example of the millowners.

13,501. Do the mills employ a great many hands?—Yes.

13,502. Where are their conveniences emptied?—They use ashpits and privies.

13,503. I suppose the refuse is not thrown into the beck?—No.

13,504. Do you imagine that there is anything seriously injurious in the smell of the soapsuds?—In speaking of the Harden Beck particularly, where we have had so much disease, and so much fever, you not only have the soapsuds, but you have the refuse of all kinds from cottages.

13,505. Human excrements?—Yes.

13,506. And are pigs kept?—Yes.

13,507. Then the brook is very foul?—Yes; so much so, that we were obliged to make a representation to the chairman of the board of health, the result of which was a hearing before the magistrates, and a promise to remedy the evil.

13,508. I suppose that the water is in a frothy condition?—Yes.

13,509. Which would tend to make the gases given off more objectionable?—Yes, and the cottages are on a very low level. There is a constant emanation of gases; and from what we have seen from year to year, they are of a very poisonous and deleterious character.

13,510. You have no hesitation in referring the disease and death of which you have spoken to the condition of this stream?—Partly to the condition of the stream, and partly to the want of ventilation, and of cleanliness in the cottages.

13,511. We may take it, that the uncleanliness of a stream of water running past cottages is so far an inducement to the want of cleanliness in the cottages themselves?—Precisely.

13,512. As for instance, in not supplying sufficient pure water for domestic cleaning?—Yes, and the people are in the habit of throwing everything which you can imagine into the stream, so as to obstruct the flow of the stream, and the gases accumulate in large quantities.

13,513. I suppose that familiarity with dirt produces a kind of moral obliquity to dirt?—Precisely so.

13,514. If a pure running stream were at the back of these cottages, the probability is, that the inhabitants of them would be more cleanly?—Yes, and it was so originally. I have resided in Bingley for 34 years; when I first came to Bingley there was nothing of this kind; they never thought of such a thing. In those days the people estimated the value of pure water, but now, cottagers seem to follow the example of millowners, and the water is very much deteriorated.

13,515. (*Mr. Harrison.*) Have you observed much change in the river Aire, as well as in the Harden Beck?—Yes. The garden which I have goes down immediately to the river Aire, and during 34 years I have watched the floods. I observed the other day that the water did not rise so high by any means as it has done on former occasions; but I observed that it came down much more rapidly.

13,516. You mean in a quicker time?—Yes.

13,517. It reached Bingley sooner after a heavy rain?—It reached Bingley sooner, and passed Bingley sooner; it went in a very rapid stream indeed.

13,518. Is it the case, that the land above Bingley was more flooded than usual?—The land was more flooded than usual, and the stream accumulated in a very much shorter time.

13,519. If the water did not rise so high, and yet passed more rapidly, how do those facts agree with the land being flooded more than before?—It seems to me from the observation which I have made, to amount to this; that so long as the river continued in its original bed, and did not much overrun the banks, the increase of damage done was confined to the banks, but when the river rose several feet above the banks, as it did very rapidly, the collateral waters seemed to impede the running stream.

13,520. Has the bed of the river at Bingley risen within your recollection?—Yes, no doubt it has risen, though I cannot say to what extent.

13,521. As your garden abuts upon the river you would be able to observe it?—Yes.

13,522. And it has done so within your knowledge?—Yes.

The witness withdrew.

Mr. William Smith (Keighley) examined

13,523. (*Chairman.*) You are of the firm of Messrs. J. and S. Smith?—Yes.

13,524. You are machine makers?—Yes.

13,525. Where are your works situated?—On the banks of the river Worth.

13,526. What number of men do you employ?—Between 400 and 500.

13,527. What area of ground do you occupy?—About 5,000 square yards.

13,528. Do you use the water for any purposes either of power or in any way in your manufacture?—For the engines.

13,529. What engine power do you employ?—About 40 horse.

KEIGHLEY.

Mr. W. Smith.

27 Nov. 1866.

13,530. What weight of coal do you consume per annum?—About 1,500 tons.

13,531. What do you do with the ashes?—We cart them away.

13,532. Have you always carted them away?—No.

13,533. How long have your works been situated upon that site?—Between 40 and 50 years.

13,534. Did you formerly throw your ashes into the stream?—Yes.

13,535. When did you cease to do so?—When the local board of health gave public notice that we were to discontinue that practice.

13,536. When was that notice given?—About 18 months ago.

13,537. Does it cost you anything now to remove your ashes?—It costs us 1*l.* a week.

13,538. Do you think that a very great hardship?—I do not.

13,539. You think that the ashes ought to be removed, though it costs you 1*l.* a week?—Yes.

13,540. And if every other person was obliged to do the same you would not wish the privilege restored to you?—I would not throw my ashes into the stream whether anybody else did so or not.

13,541. Have you been at all affected by floods in that stream?—Yes.

13,542. Is the bed of the stream any higher than when you first knew it?—Yes, far higher.

13,543. Opposite your place?—Yes.

13,544. Do you think that that is partially caused by people throwing in ashes above you?—Decidedly.

13,545. Then do you think that you have assisted to raise the bed of the stream below you?—Yes.

13,546. This system of throwing in solids necessarily raises the beds of the rivers?—Yes.

13,547. And would you say that it necessarily produces a flooding?—Yes.

13,548. And a more injurious effect?—Yes.

13,549. And if Yorkshire manufacturers go on throwing solids into the rivers they may expect their works to be flooded more than they have been?—Decidedly so.

13,550. Have you any idea what extent of loss has been suffered by this last flood?—I know that neighbours of ours have had their foundries flooded 18 inches deep and it has cost them a large amount of money. Some of their engines have been flooded and the fires put out, and their hands have been walking about the streets. That is all on account of the bed of the river having been raised.

13,551. Was that notice as to putting ashes into the stream served upon everyone as well as yourselves?—It was placarded in the streets. I am not aware that we had one personally.

13,552. Has there been a general abatement of the nuisance in consequence?—Yes.

13,553. Are you a member of the local board?—Not at present.

13,554. You have been?—Yes.

13,555. And may be again?—I do not know.

13,556. That would depend upon yourself and others?—Just so.

13,557. Is there much obstruction to the stream opposite you and above you by persons throwing in refuse?—Not at present.

13,558. You think that that has been abated generally?—Yes.

13,559. (*Mr. Harrison.*) Has the late flood at all raised the bed of the Worth?—I do not know that it has.

13,560. Has it at all lowered it?—I believe that it has.

13,561. Do you anticipate that if ashes and other refuse were prevented from being cast into the river the result in course of time would be a lowering of the bed of the river?—I believe so, and I believe that there are means by which that can be considerably accelerated.

13,562. What are those means?—We have damstones about 120 yards below the low bridge. The refuse might all be carried away, only however to another place.

13,563. Do you know the river Aire between the Worth and Bingley?—Yes.

13,564. Do you know whether the bed there has been raised?—Yes, it has been.

13,565. Is that rather a level part of the river?—Yes.

13,566. Below Bingley the river is rather more rapid?—I believe that it is.

13,567. How many years have you been connected with these works?—About 40 years.

13,568. That goes back to a time before there were railways in this neighbourhood?—Yes.

13,569. What is the difference at Keighley now in the price of coals as compared with the time before railways were made?—About 3*s.* a ton.

13,570. What do you get coal at Keighley now for?—We give about 8*s.* 6*d.*

13,571. You are almost as well off now as manufacturers in the neighbourhood of the coal fields?—There is very little difference.

13,572. Do you get coal for 3*s.* a ton less than you formerly did?—No, I mean 3*s.* more.

13,573. (*Chairman.*) Even though you have railways?—Yes, but we would not be without the railways for all that.

13,574. (*Mr. Harrison.*) Do you mean that the cost of coal now at Keighley is 3*s.* a ton more than it was before the railway was made?—Yes.

13,575. (*Chairman.*) Then I suppose that it is the greater consumption which has raised the price?—Yes.

13,576. (*Mr. Harrison.*) Where did you get your coals from before the railway was made?—Partly by canal, and partly from a place about seven miles from here.

13,577. Is the coal being worked out?—They are not getting so much as they did.

13,578. Still 8*s.* 6*d.* a ton appears to be as favourable a price as that at which mills in the immediate neighbourhood of the coal field get their coals?—I daresay it is.

13,579. Keighley seems to be advantageously situated in respect of having a good supply of water in the immediate neighbourhood?—Yes.

13,580. So that you have two of the principal elements of progress?—Yes, we are very well situated.

13,581. And the probability is that Keighley will be an increasing town?—Yes.

13,582. (*Professor Way.*) Have you ever ascertained what amount of ashes you produce?—About 1,000 tons.

13,583. On 1,500 tons of coal?—Yes, but you must understand that all our refuse from the foundry and the shop is accumulated.

13,584. (*Chairman.*) You do not mean to say that you have 1,000 tons of ashes out of 1,500 tons of coal?—No, I mean the total refuse produced at our works.

13,585. Have you any idea what amount of ashes you would have from consuming a ton of your coal; would it be one-third, or one-fourth, or one-fifth?—I do not think that it would be much above one-third.

13,586. Do you think that it would be one-third?—Yes; ours is what we call an inferior coal.

13,587. (*Mr. Harrison.*) The amount of ash depends partly upon the coal and partly upon the way in which it is consumed?—Yes.

13,588. (*Chairman.*) How many boilers do you use?—We have two boilers.

13,589. Of what kind are they?—They are Cornish boilers.

13,590. Do you make smoke?—Yes.

13,591. At your chimney top?—Yes, and at the bottom too.

13,592. Do you not think that you could do without making it?—Yes.

13,593. That is to say, if you had the same restriction as you have with regard to the ashes?—Yes.

13,594. You would not then send out smoke?—Not so much.

13,595. I suppose that now you are not required to prevent it, and do not pay attention to it ?—We pay a little attention to it.

13,596. It is more a matter of careful firing than anything else ?—Yes.

13,597. You want a better man, and to pay him better ?—Yes, and we want something else besides.

13,598. If you paid him so much more per quarter upon condition that he did not produce smoke, and if you deducted fines from his wages if he did produce smoke, he would soon find out a way not to produce smoke ?—Perhaps he might.

13,599. Is there anything further which you wish to state to the Commission ?—No, except that the effect of the bed of the river having been so raised is to dam up some drains, and the cellars of the cottages are flooded.

13,600. How many cottages do you think are so situated as to be thus affected ?—I should think a dozen in our neighbourhood.

13,601. I assume that when that takes place, it is a serious inconvenience to those poor people ?—Decidedly so.

13,602. Do you think that it is liable to cause disease ?—Yes.

13,603. If it dees not cause disease it causes great inconvenience ?—Yes.

13,604. And they are powerless to help themselves ?—Decidedly. The water comes up the drain.

13,605. Do you think that the bed of the stream has been raised since those cottages were built and the drains were made ?—Decidedly so.

13,606. How long have they been built ?—Some of them 12 or 14 years.

13,607. Then within that period the bed of that beck has risen sufficiently to back water the drains, and to flood the tenements ?—Yes.

13,608. Is it their cellars or simply their ground floors that are flooded ?—Their cellars.

13,609. Are they occupied at all ?—Not to live in.

13,610. When those drains are flooded in that way, I assume that foul water will be driven back from the drains ?—Yes.

13,611. Which will make it far worse than if it was only the river water ?—Yes. I have been called in when the cellars have been flooded with sewage as black as soot.

13,612. And stinking ?—Yes.

13,613. Could not your local board do anything to remedy that state of things ?—We tried our best. We diverted the drain in order to get a lower fall for the purpose of getting that water away.

13,614. But it is not available ?—It is not available when a flood comes.

The witness withdrew.

Mr. William Cockshott (Keighley) examined.

13,615. (*Chairman.*) What are you ?—A fellmonger.

13,616. Where are your works situated ?—Adjoining the North Beck.

13,617. At the lower part of the town, or the higher part of the town ?—At the low part.

13,618. How long have you known that beck ?—Above 50 years.

13,619. In what state is it now as compared with what it was when you first knew it ?—When I was a boy there were plenty of fish in it, and likewise it was lower by four feet or more than it is now.

13,620. What has raised the bed of that beck ?—Refuse turned in by persons above.

13,621. What number of men do you employ ?—We do not employ many, not above three or four.

13,622. What kind of rubbish has been thrown in to cause that raising of the bed of the beck ?—Principally ashes and refuse from foundries, as well as other rubbish from foundations.

13,623. And scrapings of highways ?—There is no doubt plenty of that.

13,624. In fact, I suppose that formerly persons threw in anything which they liked ?—30 years since, a gentleman who occupied a mill paid very great attention to that matter ; he had the right of the water and then no one dared put in anything.

13,625. Did he die ?—He gave up the business.

13,626. And no other person took up the right ?—There has been one since, but he has been obliged to stop his water-wheel ; it was made fast.

13,627. Have you known any of these town drains back-watered ?—Yes.

13,628. Is the water discoloured by the refuse water thrown in ?—Very much.

13,629. What is the principal discolouring matter ?—Of late there has been quite a puddle, by flushing out mill-dams.

13,630. They flush them into the beck when they like ?—Yes, which matter no doubt would make good tillage if it was taken care of.

13,631. Have you known any losses suffered by flooding from the beck ?—We have suffered ourselves. In the last flood if we had not taken precaution we should have lost above 100*l.* Our yard was four feet deep in water which has never been flooded before.

13,632. If the beck had been four feet lower, as it was when you first knew it, you would not have been flooded at all ?—Not at all. Above our premises I have known as much as 30 cart loads of refuse per week put into the beck which there is about 40 yards wide, and I have known the bed almost filled up, so that I could go over it.

13,633. By people tipping in on each side ?—Yes.

13,634. When a flood came would it take away all that refuse ?—Not altogether.

13,635. It would take some of it away ?—Yes.

13,636. Do you remember the order being given by the local board for people to discontinue throwing in those solids ?—Yes.

13,637. Has the stream been better since then ?—A little. Parties have still continued putting refuse in.

13,638. That evil is not quite cured yet ?—It is not.

10,639. And I suppose that if people within the district of the local board ceased to throw in those solids it would not necessarily affect the people outside, either above or below you ?—It would not.

13,640. Then do you think that it is requisite that there should be some power to regulate these streams, and to prevent their being filled in this manner ?—By all means.

13,641. Do you think that if the practice goes on property may be injured and life sacrificed ?—Yes.

13,642. In what way ?—A street adjoining our property, which had never been flooded before, was flooded 100 yards and more.

13,643. The surface of the street ?—Yes.

13,644. And were the floors of the dwelling houses flooded ?—I believe that on one side they were, on the other side they are a few steps above the street, and perhaps the water would not get so high.

13,645. Are you a member of the local board ?—I am not.

13,646. Do you make any refuse upon your premises ?—Very little, and what we put in is liquid ; it is spent lime-water.

13,647. Would it be very difficult for you to keep that out ?—I do not know that it would.

13,648. Do any solids come from your manufactory ?—No.

13,649. (*Professor Way.*) What is the particular business which you carry on ?—Taking off the wool from sheep skins.

13,650. What number of sheep skins have you in the course of the year ?—We have sometimes 600 a week, but now we are doing about 200 a week.

13,651. Do you steep those skins in lime ?—Yes, and we then pull off the wool.

13,652. In what form is the lime ?—In a liquid state.

KEIGHLEY.

Mr. W. Cockshott.

27 Nov. 1866.

We take burnt lime and put it on the skins and let them lie for 48 hours and then they are washed. We want clear water for our purposes. When the lime has gone into the skin we draw off and the spent lime-water flows down into the beck.

13,653. Do you put on the lime dry in the first instance?—No, in a liquid state. We put the skins into water first and wash them over with lime and a little water.

13,654. After a time they are washed?—Yes.

13,655. Are they washed in a tank?—Yes.

13,656. Are many skins put into the same tank, or is water running through it all the time?—Water is running through it all the time. It comes from the dam-stones into our tank and we wash the skins there, and then it passes into the beck again.

13,657. What is the size of the pipe?—Three inches, that is constantly flowing.

13,658. Then anything which the tank carries goes into the beck?—Yes.

13,659. Do you think that such a large quantity of water is necessary for you?—Yes. We used to wash at the dam-stones.

13,660. In that tank I suppose there is very little solid which remains?—Very little.

13,661. What quantity of lime do you use in a year?—Perhaps a cart-load a month.

13,662. And such as it is, after it is spent, it goes into the stream?—Yes. Quick-lime will kill fish, but I do not think that this lime-water will.

13,663. It goes out in a milky state, I suppose?—Yes.

13,664. What are these skins used for?—For leather

13,665. For fancy leathers?—Yes.

13,666. (*Chairman.*) Do you split the skins?—No, we sell them in the whole state and they go to be split afterwards.

13,667. But they are split?—Yes.

13,668. (*Professor Way.*) Do you wash the wool after it is taken off the skins?—No, before.

13,669. And it is sent direct away?—Yes.

13,670. That is the only thing which you do?—Yes.

13,671. And that is the only sort of skins with which you deal?—Yes.

13,672. Can you form a notion of the quantity of water which you use in 24 hours?—No.

13,673. (*Mr. Harrison.*) What head of water have you?—Perhaps it may be 1 foot fall, we have a pipe continually running.

13,674. If you were forbidden to throw that water into the stream again what would you do with it?—We should have to filter it.

13,675. I suppose that the lime gets changed into carbonate of lime—into chalk, does it not?—I do not know.

13,676. If you were to separate that part which is in suspension, do you think that the water would go away pretty clear?—Yes.

13,677. If you leave the skin too long which is destroyed, the wool or the skin?—The skin.

The witness withdrew.

Mr. JOHN MILLIGAN (Keighley) examined.

Mr. J. Milligan.

13,678. (*Mr. Harrison.*) I believe you are surgeon for the parish of Keighley?—For the Keighley district. I was originally surgeon for the whole parish but it was divided 10 years ago.

13,679. How long had you been surgeon for the whole parish?—From 1839; from the organization of the union.

13,680. We have had it mentioned that the population is now about 18,000 or 20,000, what was it in 1839?—I cannot speak distinctly to that point. There has been no great increase from 1851 to 1861.

13,681. What is the death rate in the parish of Keighley now?—I could not say unless I looked over papers. I can furnish that information to the Commissioners. I shall have to consult the registrar first.

13,682. How is it as compared with 1851 or 1839? We have been gradually improving.

13,683. You will be able to give us the facts as to that improvement?—I think that I shall be able to do so after consulting the registrar.

13,684. Have you known the river during that period?—Yes.

13,685. What is its condition now?—As a matter of course the river Aire has become considerably worse than it was, though I do not believe that it is at all so bad as has been represented by some of the witnesses.

13,686. What is the condition of the river Worth?—Our becks here have become deteriorated very much indeed.

13,687. Do you remember when there were fish in them?—30 years ago I remember trout coming up to spawn and jumping the dam stones five or six feet, to get higher up into the river, where there were sandy beds in which they could deposit their spawn.

13,688. And now there are no trout?—No. It was a very common practice for the woolcombers to come and capture trout at the dam stones; those are stones just placed across to give the water a direction down to the wheels.

13,689. Are they placed close together?—Yes; they are very great stones, very strong solid masonry.

13,690. Have you observed whether at those dam stones the bed of the river has risen within your recollection?—It has risen within my recollection five or six feet, and especially at the North Beck.

13,691. What would be the effect of that upon the sewers?—I have only heard of one case of a sewer being checked by back-water, so as not to have a free run.

13,692. Did you hear the evidence of Mr. Smith as to the effect of the raising of the bed in damming back the water in the sewers and throwing it into the cellars of some of the houses?—I did not hear that evidence. Mr. Smith is better acquainted with that matter than I am, as he lives in that part of the town.

13,693. That has not come under your notice as medical officer?—No.

13,694. You were formerly a member of the local board?—Yes, for two years.

13,695. Then would it not have come under your notice?—I only remember the cases of two cellars which were flooded, which I was requested to visit, and that flooding was owing to some defect in the drainage, there not being a sufficient fall.

13,696. When were you a member of the local board?—About a month ago I closed two years' service.

13,697. Did the local board take steps to make a supervision of the dwellings of the poor?—Yes, there was a constant supervision of the dwellings of the poor; in fact the dwellings of the poor have been improved in the last 30 years.

13,698. With a beneficial result?—Yes; my opinion is that we have been gradually improving, and that the death rate has been falling.

13,699. Are there many cellar dwellings in the town of Keighley?—We do not have them, perhaps, in the same proportion as other towns, but we have too many of them. There is a style of dwelling which I very much disapprove of, and which I think disfigures any town, namely, dwellings under balconies; they are something like cellar dwellings.

13,700. Is there a footpath above them?—Yes. Whether those dwellings are with the cognizance or approval of the board I cannot say, but I should very much disapprove of them.

13,701. Do you think that there is much ill health among persons living in those places?—I do not know that there is; they work out of them a great deal; you might go to half a dozen of them and find that there was no one in.

13,702. Is there generally pretty good accommodation as to privies in the town of Keighley?—I

think not; I think that we are very defective in that respect.

13,703. Did your local board take any steps to improve that condition of things?—Certainly.

13,704. What steps did you take?—In the way of purchasing housesteads and removing them, and putting in privies for the accommodation of the people on either side of the street.

13,705. In your practice have you been able to attribute sickness in any case to the condition of things as it was before you made these alterations?—Most certainly; privies close to dwelling houses, or under dwelling houses, are calculated to engender febrile complaints or even small-pox. I remember one case in particular in one of our new streets in this town; there were four or five privies under a house where a family lived; the small-pox came there, and we could not trace it to anything else. Seven grown up people died; in fact the whole family died with the exception of the father and mother. It did not spread further than the house just over these privies.

13,706. That you attribute entirely to those privies?—Yes.

13,707. Were you at all astonished at that result?—Not at all.

13,708. Have you examined the water in the neighbourhood of Keighley?—Some years ago when we were going to erect a new workhouse we were anxious to have a good and pure supply of water; several samples of water were brought to me in vials, for me to say whether they were pure or impure; mine was not a very refined analysis, but it was sufficient to indicate what the impurities were, and we found them to be chiefly lime, the quantity would vary very much in different seasons of the year.

13,709. Mr. Booth mentioned to us this morning that the basin of the Worth is almost entirely on the millstone grit, in fact the whole of the water which comes down to Keighley comes over the millstone grit?—We cannot tell how far the water percolates through the lime rock before it comes to us. I have always found lime in the water, and when you sink wells and pumps it is surcharged.

13,710. (*Professor Way.*) Do you think that the water of some of the wells and springs is really hard water?—I should say that the water of the wells is universally so.

13,711. And that without influence from town drainage?—Independently of the town drainage. In fact, I know one pump where patients have said that they must leave the place or must fetch water from a great distance, and at great cost. That is one of the hardest waters which I have analysed, it would leave a great amount of soap at the top.

13,712. Is it harder water than that with which we are supplied in London?—I am not aware that the Thames water runs in any lime district.

13,713. It runs through the chalk hills and the oolites. When you speak of hardness do you refer to water as hard as the Thames or harder?—There is water here very hard and there is water very soft. If you go a mile out on the Skipton Road the water is very pure, you can scarcely discover any lime in that water; but if you come on this side you will find lime in the water. The same thing prevails at Matlock; on one side of the river you have soft water, and on the other you have hard water, and the two places are within a stone's throw of each other.

13,714. You are here in the habit of calling that hard water which we should not think of calling hard water, that is probably because you have such soft water?—Yes, but all the waters which I have tested here have lime in them, which is a hardening element.

13,715. But you do not attribute any deleterious effects to that?—No, except the water has a very large amount of lime. In the case of the well which we have here the water is very hard.

13,716. (*Chairman.*) Is it sulphate or carbonate of lime?—Carbonate of lime.

13,717. Would it precipitate by boiling?—Yes; and also by exposure to the atmosphere it would become soft.

13,718. (*Mr. Harrison.*) Are there any lead mines in the neighbourhood?—Yes, about seven miles from here; the Duke of Devonshire's mines are between Keighley and Skipton, you there come into contact with the lime rock.

13,719. (*Chairman.*) Are not all the great lead lodes in lime?—Yes.

13,720. (*Mr. Harrison.*) Some of the witnesses have spoken of lead being found in the millstone grit?—It is a very extraordinary event if it is so. The thing which we call millstone grit here is the coarsest and the grittiest of the sandstones.

13,721. Is Bramley fall millstone grit?—That is a specimen of it.

13,722. (*Chairman.*) Is there anything which you wish to add to your evidence?—With respect to the river, I have known the river all my life, having been born in the district; and ever since I have known anything of it it has been very much contaminated by the manufacturers of this town and Bradford, and all the intervening villages. About 20 years ago I took this extract from the "Leeds Mercury." (*The witness delivered in the same which is as follows:*)

"Leeds Philosophical and Literary Society.

"At the last general meeting of this society held "on the 20th instant, an interesting and able paper "was read by William Osburn, Esq., 'On the epigram "and epigrammatic writings of the beginning of the "18th century,' in which the author gave numerous "examples from the writings of Dryden, Pope, Prior, "and others, and concluded with one found written "on the fly-leaf of an old book, which was of so local "a character that we venture to give it:

"'The Aire below is doubly dyed and damned;
"'The *air* above with lurid smoke is crammed;
"'The one flows steaming foul as Charon's Styx,
"'Its poisonous vapours in the other mix.
"'These sable twins the murky town invest,
"'By them the skin 's begrimed, the lungs oppressed;
"'How dear the penalty thus paid for wealth
"'Obtained through wasted life and broken health.'"

(*Witness.*) The river Aire has never been a sweet river since I knew it. I have an old manuscript history of the grammar school of this town, written by one of the rectors 150 years ago.

13,723. (*Professor Way.*) Do you say that ever since you have known the river it has been contaminated by mills between Keighley and Bradford?—Yes.

13,724. I suppose that there was a time when there were no mills?—Yes.

13,725. Then it is only a question of remoteness whether it was once a pure stream or not?—Certainly. I only speak of 150 years ago. Mr. Gale concludes with a few of the pastimes of the place, and he speaks of men catching salmon when they came up to spawn in this river. No doubt the river was pure then. They put up a lantern at the prow of the vessel and the fish were attracted by the light.

13,726. The bulk of the evidence which we have had with regard to the Aire and the Calder is that the great increase of pollution has been within these 20 or 30 years?—I lived in Bradford above 30 years ago, and I have known the contaminations poured down from the dyehouses, from Bowling dyehouse especially.

13,727. (*Mr. Harrison.*) The very fact of the prodigious increase in the weight of wool dyed now in this neighbourhood, as compared with 20 years ago, shows that the increase of pollution must be in proportion?—There is no doubt of it, but I only say that the river has been contaminated by manufacturers during the time that I have been acquainted with it.

The witness withdrew.

KEIGHLEY.

Mr. C. A. Craven.

27 Nov. 1866.

Mr. Charles Alfred Craven (Keighley) examined.

13,728. (*Chairman.*) You are superintendent of the gasworks here?—Yes.

13,729. How long have you been superintendent?—About five years.

13,730. Where are the works situated?—Adjoining the river Worth.

13,731. Does the stream pass your boundary?—It passes our boundary.

13,732. Are your works liable to be flooded by the Worth?—At the last flood the water came up to the underside of our fires, and if it had not fallen all the fires would have been extinguished, and the town would have been in darkness. The water rose up through the gravel.

13,733. It rose into the fireplaces?—Yes.

13,734. And would have put out the retort fires?—Yes, if the flood had risen nine inches higher we could not have helped the fires being put out, and it was only through great exertion that we prevented its being so on that occasion.

13,735. Have you ever known it so before?—No. We have had a man who has been at the works 40 years, and he says that he never knew a flood reach so high.

13,736. Do you think that the bed of the stream has been raised so as to cause the water to rise higher than formerly?—I do.

13,737. Have you known any solid matter to be thrown into the stream above you, such as ashes and foundation material, and refuse of different kinds?—Yes.

13,738. Do you think that that has a tendency to silt up the bed of the stream?—Yes.

13,739. What amount of gas per annum do you make?—39,500,000 cubic feet.

13,740. What amount of coa do you use?—About 4,300 tons.

13,741. What sort of coal do you use for making your gas?—The best ordinary coal which we can use.

13,742. Not the cannel coal?—No.

13,743. Do you use your own coke for roasting the coal?—Yes.

13,744. Do you make any smoke?—No.

13,745. Excepting when you are drawing the retorts?—Yes; there is no smoke from the chimnies.

13,746. Have you any ashes?—Yes.

13,747. What do you do with them?—They are now carted away, but I know that formerly they were thrown into the beck; that was before I can remember.

13,748. You do not throw them into the beck?—No.

13,749. What do you use for purifying your gas?—Dry lime.

13,750. What do you do with the refuse?—It is used for agricultural purposes, we charge 1*s.* 8*d.* a ton for it.

13,751. And you get that price for it?—Yes.

13,752. You get a good price, do you not?—I have known a better price than that. I believe that at York they get about 7*s.* or 8*s.* for it; but that is in the centre of a purely agricultural district.

13,753. I suppose that its value depends upon the nearness of the place where it is to be used?—Yes.

13,754. (*Professor Way.*) Do you use oxide of iron?—No.

13,755. Are you aware that that is a purifier?—I am.

13,756. Is there any particular reason why you have not used that method of purification?—The oxide of iron will not remove the carbonic acid, and we find that the lime which we get answers very well.

13,757. Supposing that you had a difficulty in getting rid of your lime, you might resort to purification by oxide of iron?—Yes, we might then think about it.

13,758. You do not store your lime in any stock?—No.

13,759. Do you get rid of your tar?—Yes; we sell the tar and the ammoniacal liquor.

13,760. How much do you get for the tar?—15*s.* a ton.

13,761. Is not that rather low?—Yes, but we cannot get more here, and we get 7*s.* a ton for ammoniacal water.

13,762. Where does that go?—The tar and ammoniacal water goes to the chemical works down by Bingley, the former to be made into naphtha and creosote and the latter to make sulphate of ammonia.

13,763. You do not turn any of it into the stream?—No, we can sell it; of course it is our interest to preserve it.

13,764. Have you increased your works latterly?—Yes, since I came into the management of the works. In 1862, for the year ending July the 1st, we made 24,618,000 cubic feet of gas; in 1863 we made 17,116,000 cubic feet; in 1864 we made 31,659,000 cubic feet; in 1865 we made 32,522,000, and in 1866 we made 39,481,000 cubic feet.

13,765. To what do you attribute those increases; are the streets better lighted?—Yes; a great many additional lamps have been put up, and there is a great impetus in the iron trade, I believe, for lighting up the new shops; they have begun to singe the yarn by gas, and they also use gas for the combing machines.

13,766. You do not in any way contribute to the impurity of the river?—I believe not.

13,767. When you have to repair a gas holder and to let out the water, what do you do with it?—It must run down, but we have only done that in one case.

13,768. What supply is there to the gas holders?—We have two supplies; we have the spent water from the boilers of two manufactories adjoining our place. We require about 5,000 gallons a day for all our purposes, including the keeping up of the tanks.

13,769. Why do you use that water from the boilers; is it better suited for the iron?—It is cheaper.

13,770. Is not a great deal of that water carried off in the operation itself?—Yes, and in slacking the cinders.

13,771. Have you not to add a great deal of water to the tanks?—Yes; some of the old tanks are not very tight, but we intend some day to pull them out.

13,772. From your experience in gasworks, would you say that the water diminishes in quantity even without any leakage?—In one case, I have known our largest tank to be five or six weeks without any supply of water, the quantity had diminished very little indeed. The main loss in the gasholder tanks is owing to leakage from the bad construction of the tank.

13,773. Does not it depend to some extent upon the cooling of the gas before it gets into the gasholder?—To some little extent.

13,774. The necessity of discharging that water only occurs when some repairs are required to the tank?—Yes, only in some case of emergency.

13,775. (*Chairman.*) What number of retorts have you in use?—About 80 or 90.

13,776. Are they earthenware or iron?—They are both clay and iron; about two years ago we had all iron retorts, we are now doing away with them.

13,777. Do you prefer clay retorts?—Decidedly.

13,778. Do they make better gas?—I cannot say that they make better gas, but the quality of gas is equal to that which is made from iron retorts.

13,779. Do they last longer than iron retorts?—Yes; double the length of time.

13,780. Have you any applications from mothers to bring their children in illness into the purifying house?—Yes; sometimes we have the edges of the purifiers lined with children.

13,781. For what disease do they bring them?—Chiefly for hooping cough.

13,782. I suppose that from the fact of so many coming one after another mothers think that it does their children some good?—Yes, they seem to think so, and I think that it does. I have seen a notice in

the gas journal that some French physicians recommend it very much.

13,783. Have any of your workmen at any time been afflicted with asthma?—No, none that I know of, who have been in the purifying department.

13,784. Do asthmatical people get any benefit by coming in?—We have not many of them coming there, but I believe that they would if they came there.

13,785. What effect has the purifying house upon you if you go into it; is it oppressive to you?—Not at all.

13,786. Is it injurious to the men who work there?—I do not think so.

13,787. Is any portion of the business injurious to the men?—I think not. We have one old man who has been there for 40 years, and he has worked in every department.

13,788. You do not believe in any smells from gasworks being injurious to health?—No, I think not.

13,789. Or that handling or working amongst the tar is injurious to health?—I do not think that there is anything injurious in it at all; in some cases the effect is quite the reverse.

13,790. How long have mothers brought their children to your works?—Ever since I recollect. We give them every facility.

13,791. You do not charge them anything?—No.

13,792. Do they seem grateful for permission to come there?—Yes.

13,793. Do any medical men object to their coming?—No.

13,794. (*Professor Way.*) When men get wounds on their hands is there any tendency in the wounds to run into inflammation?—No; I have not seen anything of that sort.

13,795. Do wounds heal pretty quickly?—Yes.

13,796. (*Chairman.*) Have you any steam-engines upon your premises?—We have not at present, but we are going to have one. We have one ordered now.

13,797. What is it for?—For exhausting the gas.

13,798. Are you going to get up steam by the spare heat from the retort flues?—No.

13,799. Do you not think that you could do so?—I think that it is possible. But there is this objection to it; we have three different retort houses, and we have not always the same at work, so that we must have a provision for firing.

13,800. Have you more than one chimney?—We have two chimnies.

13,801. What do you get a ton for your coke?—*8s. 4d.*

13,802. Do you find a ready sale for it?—Yes.

13,803. Do you buy any coal for firing the retorts?—No.

13,804. How much of the coke can you sell?—About 6½ cwt. for every ton carbonized.

13,805. How much do you use, and how much have you left for sale?—We make about 13 cwt. of coke per ton. We use about half, and sell about half.

13,806. About half the quantity which you have is sufficient to work your retorts?—Yes.

13,807. Then you have about half for sale?—Yes.

13,808. After you have roasted the gas out?—Yes. If we had our retorts as they have in London and other places, where they have a great number of retorts set in one furnace, we should have a greater quantity of coke to sell, but that would not be suitable for our requirements.

13,809. Is not the heat, when it passes into your chimney flue, very intense?—Yes.

13,810. Have you ever tried to make the heat serve for more than one set of retorts?—I believe that it has been tried.

13,811. Did it answer?—I am not quite positive whether they have it in some of the works in London; but I know that it has been tried. I have drawings at home of that system of setting.

13,812. By a double arrangement?—Yes.

13,813. In order to get as much out of the coke as could be got?—Yes.

13,814. Is there a sewer outlet in front of your gasworks?—Yes.

13,815. Does it form any deposit there, or is it affected by the deposit in the bed of the river?—It is affected by the deposit in the bed of the river. Sometimes we have to clear out the rubbish which has been brought down by the stream in order to keep it from backing up the drain.

13,816. The bed of the stream occasionally rises so high that it causes the water to back up?—Yes, higher up in the drain than our premises.

13,817. And to the inconvenience of owners of property?—Yes.

13,818. Do you think that that is in consequence of the bed of the river having been raised from time to time?—Yes, I believe so. At the time of the flood there was a drain on the opposite side which had got completely racked up with the waters, and it caused great inconvenience to some houses opposite our works.

13,819. Do you know to what height the water rose during the last flood, measuring from the low-water level of the beck up to the highest flood line?—I should say about five or six feet, perhaps five feet.

13,820. You did not measure it?—No.

The witness withdrew.

Mr. JOHN SHARP (Keighley) examined.

Mr. J. Sharp.

13,821. (*Chairman.*) You are the surveyor to the local board?—Yes.

13,822. You were previously surveyor to the commissioners, were you not?—There was a board of sewers for the town and parish, and I was their surveyor.

13,823. And you have been surveyor to the board of health since then?—Yes.

13,824. How long have you known Keighley?—40 years, and more.

13,825. How long have you acted as surveyor?—I have acted since 1840.

13,826. Were you a surveyor previously?—No, I started in 1840.

13,827. In what state are the rivers and becks now as compared with what they were when you first knew them?—The beds of the becks are raised considerably higher.

13,828. By what have they been raised?—By engine ashes and other rubbish which have been turned into the beck.

13,829. Have you, as surveyor, ever carted any road refuse in?—Yes.

13,830. How long since?—About a year since, or rather over.

13,831. Have you ever seen foundation material carted in?—Yes, a great deal.

13,832. How much do you think that the bed of the beck has been raised?—I can scarcely tell, but I should think 4 feet.

13,833. Has it blocked any of the drains in the town?—Yes.

13,834. It has back-watered them?—Yes. One at Low Bridge, two at Greengate, one in the South Beck, and another in the North Beck.

13,835. Have people complained to you, as surveyor, of those drains being back-watered?—Yes. We made a temporary drain down the beck side, and I think the people have not complained so much since that has been made, but they have complained several times lately.

13,836. Did the last flood back-water any drains?—Yes.

13,837. Which of them?—Along Longcroft, and it back-watered the one at Greengate; but there are not so many dwellings there.

KEIGHLEY.

Mr. J. Sharp.

27 Nov. 1866.

13,838. Have the people ceased to throw in their solid refuse since the board issued their notice?—Partially.

13,839. Do some of them do it yet?—Yes.

13,840. Have you, as surveyor, any power to report them, or to stop them?—Yes.

13,841. Do you do so if you see any person throwing in solids?—When I have seen them do it I have reported them to the board.

13,842. What do the board do if the parties do not give over that practice?—They take action and summon them before the magistrates.

13,843. And what do the magistrates do?—They seem to say that they have no jurisdiction.

13,844. You had a case before the magistrates recently, had you not?—Yes.

13,845. You, on behalf of the board, were the plaintiff?—Yes.

13,846. And you lost your case?—Yes.

13,847. Is that the case which was mentioned by the clerk to the board?—Yes.

13,848. Have you carried out any sewerage since you have been surveyor to the board?—Yes.

13,849. What sewers have you made?—We are now bringing up one from Stockbridge, and we have made one up Brunswick Street. I can scarcely tell you the number.

13,850. Of what size are they?—The one which we are now bringing up is a yard in diameter, and a yard high; 2 feet wide at the top, and 16 inches at the bottom, and covered with flat covers,

13,851. Do any of them ever press in at the sides?—Never.

13,852. What do they cost per yard?—They vary, some cost about 2*l.* a rood and some cost about 12*s.* a yard.

13,853. Are seven yards a rood?—Yes.

13,854. Have you any man-holes in your sewers?—Yes, every 20 yards.

13,855. And can you get easily to them from the surface of the road?—Yes.

13,856. You cover them with a flag and brick over?—Yes.

13,857. Do you not think that it would be better if you covered with a moveable cover, which could be removed easily?—Yes.

13,858. Have you any ventilation to your sewers?—Only by the gullies at the street side.

13,859. Are they not trapped?—No.

13,860. Are stinks complained of from them?—They have been occasionally complained of, but there is a very large flush of water.

13,861. Do the down spouts from the houses go into the drains?—No.

13,862. Do the down spouts deliver the water on to the pavement?—No, into the causeway.

13,863. And into the drain?—Yes.

13,864. Might they not act as ventilators?—Yes, partially.

13,865. Do you not think that it would be much better if your sewers were ventilated?—Yes.

13,866. (*Mr. Harrison.*) Are the houses generally connected with these sewers which you have put in?—Yes, generally.

13,867. What passes at present from the houses into the sewers?—Only their slops.

13,868. Are there many waterclosets in the town? Not very many.

13,869. How many?—I do not know exactly, but the board have always set themselves against waterclosets; they have not granted them.

13,870. Are there ashpits generally in the town?—Yes.

13,871. What becomes of the refuse from these ashpits?—It is taken by the farmers in the neighbourhood.

13,872. Ashpits are general throughout the town?—Yes.

13,873. Are they generally placed at some little distance from the houses?—Generally, but some are near.

13,874. Do you find those which are near objectionable?—Yes, they are rather objectionable, being so very near.

13,875. Are they mischievous to the health of the people?—We think so.

13,876. Do you and the board cause them to be removed when they are so?—We cause them to be removed when they become a nuisance.

13,877. Do you sewer much into the North Beck?—Yes, a good many sewers go into the North Beck.

13,878. So that you make the North Beck a kind of main sewer?—Yes.

13,879. Do you think that that is a good plan?—No.

13,880. Are many houses situated upon the North Beck?—Yes.

13,881. What is the effect upon the health of the people residing close to the beck?—I should consider the effect very injurious in some parts.

13,882. Have you known ill health arise from that cause?—Yes.

13,883. Are you taking any measures to remedy that mischief?—We are bringing up this main sewers I do not know how far the board have extended it but it is intended partially to remedy that evil.

13,884. Is the whole of the town sewered?—No.

13,885. What becomes of the water from the sinks, in the parts of the town where there are no sewers?—It is forced to lie upon the surface of the ground.

13,886. Does that give rise to bad smells and exhalations?—Yes; where the slops lie upon the surface; but generally the town is pretty well sewered.

13,887. (*Chairman.*) Has there been any general plan made for draining the town?—There has been a survey but not a general survey for the whole district.

13,888. Do you know Mr. Isaac Booth?—Yes.

13,889. Is he not acting for the board as consulting engineer?—Yes.

13,890. He has been advising you—Yes.

13,891. And you have gone over the district with him?—Yes.

13,892. Is there anything which you wish to add to your evidence?—I find that I have gone rather too far in my statement of the deficiency of drainage. There are a few short streets on the north side of the town which are not yet completely paved, and the board have given the parties notice to pave them.

13,893. It is merely a few short streets which are not paved?—Yes, but they are drained.

13,894. How soon are you going to pave them?—I do not know, I have received orders to pave Cavendish Street.

The witness withdrew.

Mr. H. Emmott.

Mr. Holmes Emmott (Keighley) examined.

13,895. (*Mr. Harrison.*) How many years have you resided in Keighley?—41.

13,896. How many years have you been inspector of nuisances?—11 months.

13,897. Do you remember the state of the streams here formerly?—Yes, very well.

13,898. How were they 40 years ago as compared with what they are now?—40 years ago I cannot tell much about, but 35 years ago they were lower from four to five feet than they are now, speaking of the North Beck.

13,899. How do you know that?—I know it by some property which goes alongside of the North Beck.

13,900. Are you interested in that property?—No, but I went to school there, which makes me know all about it, and we used to play in the beck, and I see that is has risen something like four feet at those old

buildings, which are now standing on the side of the beck. We used to go down two steps into the beck.

13,901. Do the builders in the town throw rubbish into the beck?—They do not now; they have done so.

13,902. What sort of rubbish was it?—What they excavated from cellars, foundations, and so on.

13,903. Was there much stone about it?—Yes.

13,904. Solid, hard matter which would not be easily washed away?—Yes, mostly gravel.

13,905. Have you ever examined the material now forming the bed of the river?—Not lately. I have not examined it since this flood.

13,906. What would it be two feet below the surface of the bed?—Stone, sand, gravel, and engine ashes.

13,907. You would find them all mixed together?—Yes.

13,908. Imbedded one into the other?—Yes.

13,909. So that, if persons told us that engine ashes did not harm the river much because they would be light, and would be washed clear down to the sea, that would not agree with your observation?—No, because one gets bedded into the other, and so solid matter is formed.

13,910. Can you give the number and the description of the mills and manufactories on the banks of the stream at Keighley?—Upon the North Beck I believe, that there are about six worsted mills, one paper mill, and one corn mill.

13,911. What sort of refuse do they throw in?—They used to throw in their engine ashes, till lately; they have not done so lately.

13,912. Is there any polluted water of any sort?—They turn in the water which they have used for their dyeing purposes.

13,913. Is that all that they throw in?—Yes.

13,914. Do they thrown in soapsuds and things of that sort?—Not now, they used to do so; they send them to Messrs. Teale, Le Paige, and Co.

13,915. Where do they get their supply of water?—From the beck.

13,916. For their boilers?—Yes.

13,917. And for cleansing wool?—Yes.

13,918. Is it clean enough for their purpose?—It is not at all times clean enough for what we call scouring wool, or washing it.

13,919. At these mills is there much human ordure thrown into the river?—No.

13,920. How do they manage generally about that refuse?—They generally have tanks, and mix the ordure up with soil.

13,921. And they then send it out on to the land?—Yes, for agricultural purposes. There are one or two parties, I believe, who turn it into the beck.

13,922. Are there many underground cellars in the town of Keighley?—Yes.

13,923. Do you find that in floods, like what you had a fortnight ago, the water is back-watered into these cellars?—Yes, and into the houses too.

13,924. What is the character of the water which is so back-watered into the houses and cellars?—It is muddy.

13,925. There is a smell?—Yes, very bad. I went into several places after the water had subsided.

13,926. Does the smell remain some time after the water has receded?—Yes.

13,927. Does it cause ill-health to the inhabitants?—I suppose so.

13,928. But you do not know?—No.

13,929. Have the people called your attention to that nuisance?—Yes.

13,930. What steps have you taken?—I have told them to get it cleared away as soon as possible.

13,931. Have you assisted them to do so?—No.

13,932. Have you reported to you board that steps might be taken to remedy the matter permanently?—I have not had the means of doing so since the flood but perhaps I shall do so.

13,933. Are many of those cellars inhabited by poor people? Yes.

13,934. Were they driven out the other day when the flood occurred?—Yes.

13,935. What became of them?—They had to go into their neighbour's houses.

13,936. How long will it be before those dwellings are inhabitable again?—They have to be cleaned out and whitewashed.

13,937. Were they full of water?—There was six feet of water in them I believe.

13,938. The same nasty sort of water?—Yes.

13,939. Do you think that those houses can be fit for human beings to live in at present?—I do not think that they are, but the people have gone back to them.

13,940. Should not you think that that would be a cause of sickness in the town?—Of course it would.

13,941. Are many of these low parts of the town let out for lodgings?—No.

13,942. Have you a common lodging house in the town of Keighley?—We have nine registered lodging houses.

13,943. Have you any lodging house belonging to the commissioners?—No.

13,944. (*Chairman.*) In what part of the town have you most disease?—In the upper end.

13,945. What do you call it?—Westgate.

13,946. Are there many pigstyes in the town?—Yes.

13,947. Have you power to remove them or cause them to be removed if they are a nuisance?—Yes.

13,948. Have you given notice for the removal of any of those pigstyes?—I have given notice for the closing of several of them, and I have told the parties to keep them clean or that we shall remove them.

13,949. Have you many ashpits and privies close to dwelling houses?—Yes.

13,950. Have you had to complain of any of them?—Yes.

13,951. Have you had to give notice to cleanse them?—Yes.

13,952. Do you think that they ever are cleansed?—Yes, I see that they are.

13,953. Do you think that they do not stink as badly when they are empty as when they are full?—I hardly think that they will.

13,954. They are not sweet when they are empty, are they?—No, they are not.

13,955. When you empty one of those styes it is not actually cleansing it?—No; we now use perchloride of lime.

13,956. How many men have you under you?—Three.

13,957. They are working under your orders?—Yes.

13,958. Do you look after the sweeping of the surface of the roads?—Yes, for paving.

13,959. If you find that cottage walls are dirty have you power to order them to be limewashed?—Yes.

13,960. And if a room is not ventilated, can you order that ventilation should be put in?—Yes.

13,961. Have you done so in the last twelve months?—Yes, and it has been attended to.

13,962. Do you think that that has had any beneficial effect?—Of course it has. I have paid house to house visits in the lower class of houses.

13,963. Are the people offended when you visit them?—They were rather so, but they do not seem to be offended now. When I tell them from what the evil arises, namely, from having dirty houses, they seem to be very glad to remedy it.

13,964. Where do you get water for watering the streets?—From the North Beck and from the river Worth.

13,965. Do you get no water from the waterworks for watering the streets?—No.

13,966. Are most of the houses supplied with water?—Yes.

13,967. Do any of the people there use water from the beck?—No, I do not think that they do except for washing; two or three do that I believe.

13,968. How many houses do you think were flooded by the last flood?—Perhaps a score.

KEIGHLEY.

Mr. H. Emmott.

27 Nov. 1866.

13,969. Did it injure any of the furniture of these poor people?—Yes.

13,970. And have they to suffer that loss themselves?—Yes, I suppose that they will.

13,971. Did it injure any manufactories?—Yes.

13,972. Is there a manure yard anywhere near the town, where ashes are carted to, when they do not go into the country for sale?—No, we have not a depôt for the ashes; we have for the sweepings.

13,973. Have the poor people to pay for taking their ashes out, or do they get paid by the farmers?—They used to get paid by the farmers, but now we can scarcely get farmers to take ashes away. I suppose that it will end in our having to have a depôt.

13,974. Do you not think that it will end in the board having to do the work themselves?—Yes, I think that that will be the remedy. We could get the matter in the best order if it was in that way.

The witness withdrew.

Mr. W. Burr.

Mr. William Burr (Keighley) further examined.

13,975. (*Chairman.*) Do you wish to make an additional statement to the Commissioners?—The surveyor stated, and stated correctly, that some streets were unpaved and undrained; he was referring to the street which is named Cavendish Street, but I wish it to be understood that that is a street which is not yet formed, it is not half built yet; it was only commenced about two years ago, and the proprietors of the land themselves applied to the board to put the powers into operation and to drain it and pave it at once, and not to wait until the street was finished. I wish to explain that in order to show that even in that one street the proprietors of the land were anxious that proper drains and pavement should be put in, and if there is any fault at all it is the fault of our surveyor in not having done it already.

13,976. Have you availed yourselves of your borrowing powers?—Not at all.

13,977. But you know that you can borrow for the formation of streets for 5, 10, 15, or 20 years?—Yes.

13,978. And that you can take back the money from the owners of the land?—Yes; that subject has been discussed, but, as I have already stated, our board is a very careful board, and they have hitherto refused to put those borrowing powers into operation, but they must put them into operation now.

13,972. Do not you see that the system which has been hitherto adopted is anything but economy. In the streets to which I am alluding a pair of wheels can hardly go along, and if you go on in that way through the winter the probability is that vehicles will not be able to go along them, and then if the poor creatures who live there can get their coals at all the coals must be tipped at the end of the streets and be carried to the houses by hand?—Yes.

13,980. Do you know that in Lancashire during the cotton famine nearly 400 miles of that sort of street were paved?—Yes.

(*Mr. Sharp.*) We cannot get the material to do it.

The witness withdrew.

Adjourned to to-morrow at 11 o'clock.

Keighley, Wednesday, 28th November 1866.

Present:

ROBERT RAWLINSON, Esq., C.B., in the Chair.

John Thornhill Harrison, Esq. | Professor John Thomas Way.

Mr. J. Brigg.

28 Nov. 1866.

Mr. John Brigg (Keighley) examined.

13,981. (*Chairman.*) Are you resident near Keighley?—Within a mile of the town.

13,982. Are you chairman of the bench of magistrates of this district?—Yes, I have been so for about 15 years.

13,983. How long have you known Keighley?—From infancy.

13,984. Have you been at all engaged in business?—Yes, I have been engaged in worsted spinning and in the manufacture of wool.

13,985. Are you still engaged in that business?—Yes, nominally so, but I have a partner.

13,986. Where are your works situated?—In West Lane, half a mile from this place, above the town.

13,987. Do you use water-power or steam-power?—I have two mills; one is about half a mile from the town, and there I employ steam-power entirely; and I have another two miles off above, on the stream, on the Laycock Beck.

13,988. Is that a branch?—I do not know exactly what you would call it.

13,989. Does it fall into the North Beck?—Yes, it will be the North Beck.

13,990. Do you use steam-power?—At the mill near the town I use steam-power, and the one which is two miles from this place on the bank of the North Beck is worked by a water-wheel.

13,991. Of what power is it?—About 20-horse.

13,992. Have you water at all times in the year sufficient to work your power?—No.

13,993. How long do you stand still in a dry year on an average, take last year for instance?—Last year perhaps we should have lost 60 hours during the summer months.

13,994. Is not that very small?—We have lost as much as 100 or 150 in some years.

13,995. Do you work all the time?—By the Factory Act any loss of time that arises from short water, where there is solely a water wheel, may be regained by one hour each day.

13,996. That enables you to calculate the loss by hours?—Yes; a return of that kind is made to the factory inspectors.

13,997. How long has the mill which is in your possession been worked by water-power?—It was worked by water-power before I was born. I cannot tell, but 60 years ago.

13,998. Has there been any material alteration in the character of that power since you can recollect it, or is it as good now as it was when it was first commenced?—It is much better, owing to the reservoir that we made on the moor 28 years ago.

13,999. Has the channel leading to the wheel been choked up by wreck washed down from the moor?—No.

14,000. Has the tail-goit been impeded by floods?—Yes, occasionally by wreck which has been brought down by floods, as on Friday week last; we had more wreck accumulated in the goit then than we had had for seven years; it threw us into back water.

14,001. Have you to remove that by hand?—Yes; it is too heavy to flush.

14,002. What will it cost you to clear the tail-goit after the last flood?—Perhaps from 5*l.* to 10*l.*

14,003. Are there any factories on that stream?—No, we are the highest.

14,003*a*. Is there any solid refuse thrown in above your mill?—I believe not, not the slightest.

14,004. Do the banks subside at times and wash in above you?—I do not think they do; the North Beck is exactly as wide as it was when I recollect it first.

14,005. How many hands do you employ at that mill?—I employ perhaps 40 there.

14,006. Do you dye or wash?—Neither.

14,007. Do you use water for any purpose in your manufactories?—All the water that we use there is for turning the water-wheel; I except what is used at a cottage on the premises for domestic purposes.

14,008. Have you any privy accommodation for the hands employed in that mill?—Yes, but not on the banks of the river.

14,009. Does any refuse pass into the river?—No.

14,010. You do not pollute the stream by that mill in any way?—No; the privies are on the opposite side of the building to the water; we contract with a farmer to take away the excrement.

14,011. Do the farmers pay, or do you pay them for taking it away?—It is a tenant of my own who takes it; I let him have the privilege of taking it away, but he takes it away at his own cost. When the refuse has accumulated in the troughs he is sent for and takes it away.

14,012. Do you think the floods are as heavy now as they were when you first knew the river?—Not at our mill, in consequence of the reservoir that we have made; that has altered the conditions of the stream all the way down.

14,013. What volume do you send out of that reservoir on each day?—That depends upon the quantity that we want.

14,014. Is that a reservoir that you made yourselves?—No; it is a reservoir that was made upon the Duke of Devonshire's property originally.

14,015. (*Mr. Harrison.*) Is that reservoir about five miles to the westward of Keighley?—Yes.

14,016. (*Chairman.*) Did the Duke of Devonshire make it for you or for his tenants?—Originally the duke advanced the money, but we paid a certain amount of rental for 14 years after that. I happened to see his grace, and he said to me, "Is it a good thing?" I said, "Yes." "Then," said his grace, "Would it not be a good thing to have another?" I suggested the propriety of enlarging the present one, as the bank was sufficiently strong, and his grace then sent an engineer to examine it. He considered that it might be safely raised six feet higher. We rented it first for 14 years and then for 10. Four years have now gone in a 21 years' lease. I hold in my hand an extract from a report by Mr. James G. Lynde, junior, upon the Keighley reservoir, December 28th, 1853, which was sent to the agent of the Duke of Devonshire in London, William Curry, Esquire. It is in these terms:—

"During eight months of the year there would be a "deficiency of water at the mills without the reservoir "of 238 cubic feet per minute for ten hours a day. "The surplus water during ten hours a day for the "remaining four months is equal to 14,063,184 cubic "feet. The drainage area belonging to the reservoir "is 445 acres, and the average flow of water per acre "due to a depth of 18 inches rainfall is 124 cubic "feet per minute, which would give an average flow "into the reservoir during the year of 55·18 cubic feet "per minute. The reservoirs or dams attached to "the several mills are capable of storing about "one and a half hour's supply. This added to the "10 hours work gives 11½ hours for each day during "which the millers can availably use the whole "stream. During the remainder of the 24 hours, "which will be 12½ hours, the water may be stored "beneficially. At the rate of 55·18 cubic feet per "minute, 15,104,525 cubic feet can be stored per "annum at the level of the present reservoir. "Between the reservoir and the highest mill on the "stream there is a large drainage area, for which a "storage reservoir might with advantage be con-"structed, but this does not affect the present ques-"tion. I estimate the contents of the existing "reservoir at 5,749,920 cubic feet, and it is capable "of affording a supply of 138 cubic feet per minute "for ten hours a day during eight months of the "year. The value of this to each mill will be pro-"portioned to the heights of the falls, which, as near "as I can learn, without making an actual survey, "are as follows:—

Name of the mill.	Height of fall.	Horse-power.	Annual value.
	ft. in.		£ s.
Goose Eye Mill	30 9	4	32 0
Turkey Paper	29 0	$3\frac{4}{5}$	30 8
Wood Mill	21 0	$2\frac{7}{10}$	21 12
Holme Mill	21 4	$2\frac{4}{5}$	22 8
Hill Top Mill	9 0	$1\frac{1}{10}$	8 16
Castle Mill	23 3	3	24 0
North Beck Mill	24 0	$3\frac{1}{10}$	24 16
Becks Mill	14 8	2	16 0
Corn Mill	21 6	$2\frac{4}{5}$	22 8
Hattersley's Mill	3 10	$\frac{1}{2}$	4 0
Cabbage Mill	16 0	2	16 0
Low Mill	20 0	$2\frac{3}{5}$	20 16
Strong Close Mill	9 0	$1\frac{1}{10}$	8 16
Stubbing House Mill	14 0	$1\frac{4}{5}$	14 8
			£266 8

"This is in my opinion the most economical method "of increasing the powers of the mills, and so long "as there is any surplus water to be stored, it will "always be worth the while of the millowners to "construct additional reservoirs rather than resort "to steam power. To Wm. Curry, Esq." The above report supposes that the reservoir can contain all the water that falls, and that the reservoir is emptied $2\frac{2}{3}$ times every year, which is not the case, as is seen by the water which passes by when the reservoir is full.

14,017. The paper which you have read contains a tabulated list of the names of the mills, height of falls, horse power, and annual value. Is it the estimated value, or is it the actual rental that is paid?—The rental is 112*l*.

14,018. What is the annual value that is put down?—I do not know. That is Mr. Lynde's estimate. It is all in Mr. Lynde's report.

14,019. The estimated value in the paper you have read is 266*l*. 8*s*. 0*d*.?—Yes, according to Mr. Lynde's estimate.

14,020. And how much do you pay?—112*l*. is paid upon 12 mills. It would have been 120*l*., but two mills have ceased to use the water. That shows the actual value paid now. There are, as I have said, about 12 contributors at the present time. Since this report was made another mill has been built on the stream, and that pays 2*l*. a year for taking water out of the beck for engine purposes. Those 12 mills now pay 112*l*. and a few shillings. That is the rental paid to the Duke of Devonshire.

14,021. It is a rental paid for the water that is turned down that stream?—Yes, the water is impounded, and we have the advantage of it.

14,022. Is it a rental for the land upon which the premises stand?—The reservoir occupies, I believe, 20 acres, and is built on land belonging to the Duke of Devonshire.

14,023. Does the rental paid for the water include any rental for land used at the mills?—No, not at the mills.

14,024. It is simply for the water?—Yes.

14,025. What is the depth of the bank?—I cannot say.

14,026. With regard to the mill near to the town, do you use water or steam power there?—Steam power exclusively.

14,027. What do you manufacture there?—Worsted yarns and manufactured goods. Various textile fabrics.

KEIGHLEY.

Mr. J. Brigg.

28 Nov. 1866.

14,028. What number of hands do you employ?—Perhaps 600.

14,029. What weight of coal do you burn per annum there?—About 36 tons a week.

14,030. What do you do with the ashes?—We contract with the Midland Railway Company to take them all; we send them.

14,031. Do you at any time throw the ashes into the beck?—No, we are too far away.

14,032. Which is the stream nearest to you?—The North Beck.

14,033. Do you take water from that beck for engine purposes?—No, we get water from natural springs in my own ground.

14,034. Do you use water for washing wool and dyeing?—Not for dyeing.

14,035. What sized pump do you use?—I cannot state exactly.

14,036. Do you get all that water from springs on your own premises?—Yes.

14,037. Does it go away from your premises polluted?—Only so far as it has gone through the boilers, nothing more. We have a reservoir at the lower mill to store spring water for the use of the engines. The stream is not sufficient without storage, the overflow from the reservoirs goes through my own lands into the beck.

14,038. Do you ever cleanse those reservoirs out?—No.

14,039. Do they never get silted up?—No, we have never had them so.

14,040. What arrangement for privy accommodation have you made for the hands employed at that mill?—We have I do not know how many privies, not exactly common privies, because they have seats. They are more in the shape of waterclosets. The sewage is conveyed in iron pipes to one point, and there we have a strong waggon, made on purpose, which runs underneath and receives the contents of six or eight privies.

14,041. The refuse is carted away to the land?—Yes, and we have a similar arrangement also in the sheds.

14,042. Do you mean the weaving sheds?—Yes, and in all cases there is not the slightest loss or leakage from the privies, as we have wooden waggons sufficiently tight and strong to retain the whole of the liquid until they get full. Once a fortnight the sewage is all carted away on to our own land and laid up for manure, which we consider very valuable.

14,043. You have it taken on to your own land, and you consider it is beneficial for agricultural purposes?—Yes.

14,044. You find that it pays you for the cost and trouble you have incurred?—Yes, it costs us a good deal, but that is nothing in comparison with the accommodation afforded by the privies, and the advantage we derive from applying it to our own land.

14,045. Do you use wool exclusively in your operations at that mill?—As far as spinning is concerned we use wool exclusively, but in the manufacture of textile fabrics we use silk and cotton.

14,046. Any shoddy?—No.

14,047. Is any shoddy used with the wool?—No, I think not. I am not aware that any is used on this side of Bingley.

14,048. What engine power do you use at the lower mill?—The estimated power is 50-horse, but it actually works up to 80-horse power.

14,049. That is by the pressure of steam and the method of working it?—Yes.

14,050. Can you state the nominal horse power?—110, but we work the engines to do more than that.

14,051. Have you considered the question whether your steam power is as economical as your water power?—Water power is much more economical where we can have a continuous flow of water.

14,052. You work on steadily, and you prefer water-power under those circumstances?—Decidedly.

14,053. Is water power as good and as steady for the machinery?—Equally so, for both water power and the steam engine are regulated by a governor.

14,054. If you could obtain all your power from water, you would prefer water to steam?—Yes, but it is necessary to take into consideration that situation makes some difference. If at the place where my steam power works are I could have water, it would be a very great advantage. But steam power on a convenient site might be better than water power at a place in the country four or five miles away from the town, with bad roads.

14,055. If you had all the goods to cart to and from the upper mill you must take into account the situation?—Yes, and the distance from a railway.

14,056. In what condition do you find the rivers and becks in and about this district, as compared with their condition when you first knew them; have the beds been raised by floods?—The beds of the becks near the town have been raised by accumulations.

14,057. Of what kind?—The principal part of the accumulations in the beck originally came from digging out cellars, foundations from houses were so disposed of; but as manufactories increased, and steam power increased, a very large quantity of engine ashes was produced; those engine ashes, generally speaking, found their way into the beck. Some parties would purchase land with a fall a short distance from the beck, or immediately on it, and would deposit their ashes there to be carried away when a flood came.

14,058. They considered the beck the proper place to take their ashes to from their premises?—Yes, and no attempt was made to prevent it until in recent years.

14,059. The parties considered it an advantage to be in a position where they could so dispose of their ashes?—Yes, but that was some time ago; more recently they have not been doing so.

14,060. At the present time do any parties within your knowledge put their ashes into the beck?—I believe that nobody does it now, but I do not think I am a good authority for that.

14,061. Have you any jurisdiction over streams or becks to prevent that pollution, or have any cases been brought before you?—Yes.

14,062. Have you power to interfere?—Yes, under the Local Government Act we have. A case occurred not long ago, and an appeal was made to the Court of Queen's Bench against our decision. The decision come to by the magistrates was reversed.

14,063. Have any complaints been made with regard to the becks outside the district under the local board?—I do not remember one, a great many of the mills in the district are within the borough.

14,064. In the event of the legislature passing any measure to prevent this abuse and pollution of streams, does your experience enable you to give us any opinion as to whether or not it would come within the range of your duties to prevent pollutions by means of the police?—Yes, I think it might.

14,065. How far does your jurisdiction extend?—Over the whole area, within a radius of six miles from this place. It is rather a division of a wapentake, it was formed when I was put on the commission of the peace.

14,066. For what purpose was that circle so laid down?—Simply for the convenience of the public, we take a certain portion of the wapentake.

14,067. Are all your decisions given in that district subject to revision by a larger section of the magistracy of the riding?—In cases of felony etc., the petty sessional magistrates cannot imprison, but the prisoners are sent to the quarter sessions, and then are tried before a jury. We are one division out of 25 divisions in the West Riding of Yorkshire, and we have over 50,000 inhabitants.

14,068. Do you use soap in your manufactures to any extent?—We use a washing material. We wash the wool, but we use very little of what is commonly known as soap.

14,069. What do you use?—We use oil and alkalies as a substitute for soap.

14,070. What weight do you use of those materials in a week?—We use a ton per week; after the washing has been done the liquid is filtered and the solid part thrown down.

14,071. By Teall's process?—I do not know exactly who the patentee is. We are paid according to the number of packs of soap consumed. The lessees have a reservoir where the waste liquid is impounded.

14,072. Do you know what number of packs of soap you use in a week?—We use I believe a ton of soap.

14,073. What sum do you receive for the recovered material?—I think it is about 4*s.* 6*d.* for each pack consumed and a pack means 240 lbs.

14,074. You are put to no cost?—No.

14,075. Have you to find room for the tanks on your premises?—Yes, the liquid is impounded there. They purify it, and then they cart the scum that rises to the surface away from our works. They take it down to the works where they take all the refuse, and I suppose the works are just below this town, near the railway station.

14,076. How long has this operation been carried on of extracting this material from soap waste?—In this district for perhaps seven or ten years.

14,077. Do all manufacturers who use soap save the refuse soapsuds and have them treated in a similar way?—I suppose they do, because it costs them nothing.

14,078. Do you know what income it produces you per annum?—No, I do not.

14,079. (*Professor Way.*) 120*l.* or 130*l.* a year?—I should say 130*l.* a year.

14,080. (*Chairman.*) They take away what they like and leave what they like?—They take away all the solid matter, and put the suds into a large cistern; after the suds have stood a certain time they put in a quantity of acid, which brings on to the surface perhaps three or four inches of thick greasy matter, that is put into a cart and taken away, and passed through some process which I do not understand.

14,081. What is done with the waste water?—It runs down through the land, and eventually gets into the beck.

14,082. Does it pass on to the land for irrigation purposes?—Yes.

14,083–4. And helps to grow grass?—Yes, a certain amount of sediment lodges in the open drain.

14,085. Do you attempt to put the waste liquid over the surface of the land to irrigate it?—One of our men does it regularly.

14,086. He irrigates his grass land with it?—Yes, he diverts the sud-refuse out of the watercourse.

14,087. (*Mr. Harrison.*) After an acid has been used?—Yes.

14,088. (*Chairman.*) You get out the solids and use that for manure?—Yes; there is a certain amount of sediment that lodges in the drain as it runs down, after the greasy matter has been taken from it; that drain is opened and cleaned out, and then the sediment is thrown on to the land; in other cases one of our men diverts the water over his land and spreads it over the land.

14,089. And it does not injure it?—No; he continues to do it, so I suppose it does not.

14,090. (*Mr. Harrison.*) By the time the water is discharged into the river is it purified?—It is not perfectly clear, it is a little discoloured; but it has nothing like the appearance of the suds that come from the washing machine.

14,091. (*Professor Way.*) You stated that you did not buy any soap; are the articles that you spoke of, viz., grease and alkali, boiled in a copper at your works?—Yes.

14,092. Then you make soap, you do not buy it?—Yes.

14,093. (*Chairman.*) During the last flood did you sustain any injury?—Yes, a little at the water-mill.

14,094. Was any injury done at your lower mill?—Not at all; we are quite above these floods.

14,095. Did you notice the condition of the valley of the Aire; was much injury done by the flood in the valley below you?—I live to the west, and I went on to the hill, and I saw the valley all covered with water; at least there was a large quantity of water looking like a sea. On the day following I rode down a road which had been covered by the flood; the water had washed walls down, which it had not done for many years before; but I have seen that done many times when there has been a higher flood on that road. I think there was more water in the river this time than before; and the reason was, that in taking the Stockbridge dam stones down they had reduced the level of the water under the bridge 5 feet, and consequently caused more water to go down the Aire.

14,096. Do you think that this last flood was as large a flood as you can ever recollect?—Yes, it was in volume of water, but it did not cross the road so much as I have seen a flood do, and the reason of that was the removal of the dam stones at Stockbridge about a year ago.

14,097. (*Mr. Harrison.*) Is there much water-power in Keighley?—Not very much; there are three or four water-wheels, but not many; the larger proportion of the propelling power is steam.

14,098. It was stated yesterday in evidence that the bed of the Worth had been raised four or five feet within the memory of inhabitants?—Yes, it has been considerably raised, but I have not noticed it myself. I have not sustained any injury by it.

14,099. Do you know whether the water-power at Keighley has been much injured by the filling up of the bed of the Worth?—Yes, as in the case of what is called Cabbage Mill. The accumulations were allowed to go on in the Worth there until they actually raised the bed of the river so high that the water could not empty itself out of the goit from the water-wheel, and that water-wheel is standing still to this day.

14,100. What power might they have had formerly at that mill?—I have no idea. At another place they made a weir down the centre of the beck, and of course that has preserved them a good deal; the tail-goit is open, and when there is a flood it overflows it; when there is a moderate flood the tail-goit empties itself two feet lower than the bed of the river.

14,101. Have you observed whether the water which passes through the town appears in a dry season to be diminished in consequence of the filling up of the bed?—I have not. I think that the accumulations in the stream have not yet diverted the stream from its natural course. I am not aware of any instance of that kind.

14,102. What do you consider in the neighbourhood of Keighley is the relative value of water-power and steam-power?—Where there is a full supply of water water-power is equal in value to steam-power of the same horse-power; but there are very few instances where that is so. Water-power would not let for so much, because there is the danger of short water, and upon the whole a man would not trust to water-power as being as regular as steam-power.

14,103. If you were taking a mill, at what would you put the relative value?—I have no idea; but perhaps 15*l.* per horse-power.

14,104. How much would you set down for water-power?—If it could be as constant as steam it would be of the same value, but it is not. Its value depends entirely upon what water they do get, consequently it is a matter of speculation.

14,105. What do you reckon that your steam-power costs you in coal and interest on capital laid out on machinery and in repairs per annum?—I do not know what a steam-engine is considered to consist of; the first moving shaft is considered the freehold of the place; all the rest of the steam-engine is mechanical.

14,106. How would water-power be rated in this neighbourhood as compared with steam-power in determining the rateable value of the horse-power—by the shafting?—I cannot answer that question; but I

KEIGHLEY.

Mr. J. Brigg.

28 Nov. 1866.

believe that an estimate of so much per floor and so much per horse-power is made, and so the rateable value of the premises is ascertained.

14,107. Is there anything further that you wish to add?—There is a reservoir that has been alluded to; that reservoir has been made 28 years, and it has been inspected by Mr. Lynde. After the Holm Firth flood the Government sent down an inspector, and he went to Holm Firth to ascertain the cause of that disaster; from there he came to Keighley to examine this reservoir; he made a minute inspection of it, and said that it was most perfect and safe, that the foundation was upon a rocky material. There is a pitched front, with large rubble stones; the by-wash is 16 yards wide, and during the flood on Friday the water did not cover the whole of the by-wash; about 2 o'clock it ran over about 6 inches, and from 3 to 4 o'clock it ran over 9 inches; the top of the high-water level is 5 feet below the bank, the by-wash is 5 feet below the embankment itself, and upon that embankment is a 4-feet wall besides; a wave came and dashed the spray over the 5 feet, and threw it over on the other side; we put a wall there to prevent the spray going over, and after the flood I went to see, and not a stone was in the least moved.

14,108. Is the water drawn to the bottom of the bank out of an iron pipe, or out of a stone culvert?—An iron pipe. Suppose this was the inside of the bank (*describing*); formerly we had a pipe that came through the bank, and we let the water out at the low end; but that was not safe, as some of the joints might give way in the centre of the bank from the pressure of the water; we therefore drew the dam out and put a sluice or clough inside, so that we have no water in the pipes, excepting when we draw it; the clough is worked by large rods on the top of the bank, and now I have as much confidence in the security of that bank as I have in my own house.

The witness withdrew.

Mr. R. L. Hattersley.

Mr. Richard L. Hattersley (Keighley) examined.

14,109. (*Chairman.*) You are a member of a firm of machine makers?—Yes.

14,110. What machines do you make?—Principally power looms.

14,111. For the manufacture of woollens?—Worsted.

14,112. Where are your works situated?—On the North Beck.

14,113. Are they above or below the town?—Nearly in the centre of the town.

14,114. What area of ground do your works cover?—Perhaps 3,000 square yards.

14,115. What length of frontage on the beck have you?—Nearly 100 yards.

14,116. Do you own both sides of the beck?—The beck runs the whole length of the old premises, and partly underneath; then there is a road down the other side of the beck, and we have other buildings on the other side of the road.

14,117. Do you consider that that portion of the beck which flows through your premises belongs to you?—Yes.

14,118. Have you put any arches over it?—Yes, we have buildings over the beck.

14,119. Then it runs entirely under certain buildings?—Yes, entirely under buildings.

14,120. How long have your works been there?—Some portion of them have been there for 60 years, I think.

14,121. How long have you known the beck or the works?—I have never lived anywhere else. I have been in the place 32 years, and more than that.

14,122. Do you think that the bed of the beck has risen during that period of time?—Yes, opposite to our premises.

14,123. Have you tried to keep it down?—Not particularly, except in a time of flood; in the last flood we did not take any steps.

14,124. Have you at any time suffered from flooding?—No, I do not know that we have.

14,125. Did you suffer during the last flood?—I do not know that we did.

14,126. Do you use engine power?—Yes, exclusively.

14,127. What weight of coal do you burn per annum?—From 800 to 900 tons.

14,128. What do you do with the ashes?—We put them principally into the beck course, and we cart part of them away.

14,129. Do you put them principally into the beck?—Yes, not entirely.

14,130. Have you ever seen the notice issued by the Board of Health against that practice?—Yes.

14,131. Have you paid any attention to it?—Not much.

14,132. Supposing a restriction was put upon you, and you were told that you were not to put ashes into the beck any more, what would you do?—Our place is a very awkward place, and we have to lead the ashes to the land if we cart them away, therefore it is a great convenience to us to be able to put them into the beck; we do not make a very great quantity, I think about 6 cwt. a day.

14,133. Whether the quantity be large or small, if all persons were to be restrained from putting ashes into the rivers and streams, do you think you would escape?—Certainly not.

14,134. What would it cost you to take the ashes away a year?—It would cost 40*l.* or 50*l.* to cart away all the refuse that we make; what we make in the foundry we do not put into the beck at all.

14,135. Do you use water for any purpose but for the boilers?—Yes, we use water for turning the iron, that is, for grinding.

14,136. Not any large quantity, I suppose?—No.

14,137. You do not foul the water very much?—No.

14,138. Do you take water out of the beck and send it back again after you have used it?—Yes.

14,139. How many men do you employ?—About 250.

14,140. Have you any privy accommodation on the premises?—Yes.

14,141. Where does the refuse go?—Part of it goes into the beck, and part does not. Part goes on to the land; we cart it away every week or fortnight.

14,142. Do you think it would be difficult to keep all the privy refuse out of the beck?—Yes, because on the old premises we have no yard.

14,143. You occupy all the ground, do you?—Yes, and the refuse has gone into the beck ever since I knew it.

14,144. Have you seen or heard of the newly invented earth closets, which is an arrangement in the shape of a watercloset, only dry earth is used in place of water?—I have not seen them, unless I once saw one at Blackburn.

14,145. Supposing it was proved to you that without altering your privies you might introduce one of these contrivances and intercept all the solid refuse and take it away, should you consider it a great hardship to be compelled to do so?—No, I do not think it would be a hardship; we should not object.

14,146. Has the beck ever been filled in at all by refuse thrown in at any other point than opposite to your premises?—Just below our premises there is a dam stone and a mill, now given up, and I believe the beck course is wrecked up from this dam stone to the one below. I do not think the same is the case either above or below.

14,147. Did you hear the evidence that was given yesterday?—Yes.

14,148. Did you hear that some of the drains were choked up in consequence of the bed of the beck having been raised?—Yes, from 4 to 5 feet, in that part which the witness alluded to. There is a bridge

perhaps 200 or 300 yards below our place, and this morning we measured 4 feet 9 inches from the beck course to the under side of the crown of the arch. 15 years ago a flood carried away a boiler from the side of the stream, and it passed under that bridge with some difficulty, but that boiler was 6 feet 6 inches in diameter.

14,149. I suppose it could not go through now?—No, because there is only a space of 4 feet 9 inches; that is the average space; the bed has risen there. After the flood we could not see how the boiler had gone underneath, for it appeared larger than the space there was for it, but the boiler did go through, and it rested on the low side of the bridge.

14,150. Do you think that the boiler from blocking the archway up caused the water to scour out the beck, and so was forced through?—I think that the boiler ploughed its way under the bridge, and so went through.

14,151. (*Professor Way.*) The bed of the river would fill up afterwards, would it not, as the flood subsided?—Yes, but that was not so heavy a flood as the recent one, nothing like it.

14,152. Do you think that the floods are as heavy now as they were when you first knew the beck?—Yes, the last one has been as heavy as any I have seen.

14,153. Are you aware that many persons have had their cottages flooded?—No; a few below were flooded, two or three, just below the bridge.

14,154. And other premises?—Yes, the water came over the bridge there.

14,155. You have stated that it would cost you about 40*l.* or 50*l.* to cart away the ashes, would that be a very serious matter to you?—Only to that amount.

14,156. You say that you employ 250 men?—Yes.

14,157. May I put the expense at about 1*l.* a week?—Yes.

14,158. Then it would be about a penny per head of your men?—Yes.

14,159. It would be the same thing to you as if you raised the wages a penny per head to all of your workmen?—Yes, about that amount.

14,160. I suppose a sum like 40*l.* or 50*l.* is not very serious outlay for the benefit of the public?—No, it is not a very large expense. I do not believe that the filling up of the beck course where it has taken place is due to anything that millowners cast in at present. I do not think that there is a large amount of ashes in that part of the beck course which is filled up; I believe it consists principally of stones and gravel, and diggings of foundations.

14,161. Do you think that diggings from foundations should be allowed to pass in as heretofore?—Not if the beck course is not to be filled up.

14,162. If diggings from foundations do fill up the beck course, do you think that ashes have no tendency to do the same?—They must fill it up, certainly, but I believe that they are taken to a greater distance than the other refuse is.

14,163. Are you aware that the last flood has done an enormous amount of damage all the way down the valley?—I believe it has.

14,164. That it has flooded land and premises to an extent that has scarcely ever been remembered before?—Yes, I believe so.

14,165. And that to estimate the loss sustained along the valley, you must measure by scores of thousands of pounds?—Yes, I am aware of that.

14,166. Considering these things, that this town and all places above it—Todmorden, for instance—have thrown for the last half century thousands of tons of solid refuse into the streams, do you not think that the flood has come like a punishment upon them?—No.

14,167. Taking the broadest view of the case, should you say that it would be right for the Government to allow things to go on as they have been, and permit persons who may say that they would find a difficulty in doing otherwise to throw ashes and other refuse into the streams?—I do not think that ashes are much detrimental in this district; I do not see where they have caused much damage, if any.

14,168. (*Mr. Harrison.*) Have you been down the stream to see whether any damage had been done below?—Yes; I have been down the river Aire from this place, and I cannot see from my observation that the beck course has been filled up below the dam stone next but one below us.

14,169. Then you must go down to where the Aire and where the Calder are navigable?—I do not know much about the river Aire below.

14,170. (*Chairman.*) Assuming that beck courses are filled up by the wrack which is brought down by the floods and the gravel, do you think it is desirable that this state of things should be continued, and that it should be no person's duty to keep such matters out?—Certainly whatever fills up the river course below would do injury.

14,171. There is a beck course not many miles below Keighley, and it is clear that the bed of the beck is three or four feet above the level of the adjoining land?—I have not seen anything of that sort; there is nothing of that sort in our beck, but that is caused by engine ashes, and I do not know whose business it is to rectify that.

14,172. Would it not be a benefit to everybody if it was somebody's business to rectify that state of things?—Certainly I should think so.

14,173. Are you aware that a rough estimate has been made, showing that more money has been lost in one week by the flood than, if properly laid out, would have put the river into such a condition as to have prevented the evil effects of such a flood?—Yes, I have no doubt of it.

14,174. It is estimated that more than 50,000*l.* worth of damage has been done at Leeds?—I do not think, so far as we are concerned, that we shall object to do what we can to remedy the evils existing in our own district, but we do dislike to be the one party to be picked out and told not to do what other people are allowed to do.

14,175. If you were all put under the same regulation you think you would comply with it?—Decidedly.

14,176. You would then feel that you were not being punished exceptionally, or from party spite?—Certainly.

14,177. Is there anything further that you wish to add to your evidence?—I think not. We think that if the sewage was kept out of the watercourses in our district the water would be as pure as ever it was.

14,178. And you would be benefited to that extent?—Certainly; the smell of the flood that came down was not at all agreeable.

The witness withdrew.

Mr. Edward Townend (Cullingworth) examined.

Mr. E. Townend.

14,179. (*Chairman.*) Are you a worsted spinner?—Yes.

14,180. Where is your mill situated?—At Cullingworth, one of them.

14,181. On what stream?—The Cullingworth Beck.

14,182. Into what river does it fall?—It falls into the Harden Beck, and that falls into the river Aire.

14,183. How far are you in a right line across from the Aire?—Three miles.

14,184. Do you use steam power or water power?—I use both.

14,185. What amount of water power do you use?—We have four mills.

14,186. On that beck?—No, only one on the Cullingworth Beck.

14,187. Where are the other three?—One is on Ellar Carr Beck, which flows also into the Harden Beck

14,188. Have you any names for the mills?—Yes.

KEIGHLEY.

Mr. E. Townend.

28 Nov. 1866.

14,189. Will you name one?—The largest one is Cullingworth Mill.

14,190. And the next?—The next is "The little mill" at Cullingworth.

14,191. What is the next?—The next is Woodfield Mill, and the next is Ellar Carr Mill.

14,192. What is the manufacture at the Cullingworth Mill?—Spinning and combing.

14,193. What number of hands do you employ?—We employ about 1,000 in that mill, or nearly so.

14,194. Do you employ engine power?—There is no water power at the Cullingworth Mill.

14,195. What weight of coal do you burn in a year?—At all the mills we burn (including what is required for the steam engines) about 120 tons of coal a week.

14,196. What business is carried on at the little mill?—Spinning, exclusively.

14,197. What is done at the Woodfield Mill?—Solely weaving.

14,198. And at Ellar Carr Mill?—Weaving only.

14,199. At which of the mills do you use water power?—At the Ellar Carr Mill we use partly water and partly steam power.

14,200. What amount of water power do you use?—It is rather irregular, but I think it is about 8-horse.

14,201. Are you on the Bradford Waterworks stream?—No.

14,202. Do you use soap at your mills?—At Cullingworth we do.

14,203. What number of hands do you employ altogether?—I should think about 1,200 altogether, but I cannot speak to within 50.

14,204. That is at the four mills?—Yes.

14,205. Are they all engaged in the worsted business?—Yes.

14,206. What privy accommodation have you for your hands?—There are separate privies at each mill, and the sewage is all taken out and mixed with ashes, which we collect from the cottages.

14,207. You do not pollute the stream?—Not at all by the privies.

14,208. Do you use much water for washing the worsted?—Yes, and we take it from a reservoir at Cullingworth Mill.

14,209. Of what area is that reservoir?—It is about 60 or 70 yards square.

14,210. Does it receive water from springs?—Yes, and from the drainage of the hills and the roads.

14,211. Is that sufficient for all your washing purposes?—Yes, except in extreme droughts. In the summers of 1864 and 1865 we were very nearly standing still at the works for want of water, and we were put to considerable expense for washing. We resorted to a spring which we had in a field near to the works, and we conveyed the water from that spring into the works through a pipe.

14,212. How much water do you use daily in the washing process?—I cannot tell.

14,213. What sized pipe does the water flow through?—It is a 6-inch pipe.

14,214. Does it get full?—No, half full; but the water is not continuously running.

14,215. What weight of soap, or an equivalent for soap, do you use for washing?—My evidence upon that point would be the same as Mr. Briggs'.

14,216. How many packs do you use in a week?—About 12 packs.

14,217. Is the grease afterwards extracted?—Yes.

14,218. Is that done by yourselves, or do you lease it?—By ourselves. It is treated on Messrs. Teall's system.

14,219. (*Professor Way.*) Do you pay a royalty to them?—No.

14,220. Is it treated by heat at all?—Yes. I should mention that in the first instance we let our suds to Messrs. Teall for several years, and then they gave it up, and we took to it ourselves.

14,221. You carry out the process up to the point of squeezing out the grease?—Yes.

14,222. Do you sell the grease?—Yes.

14,223. To Messrs. Teall?—No.

14,224. What quantity of grease do you extract per week?—I think we extract about a ton and a half per week.

14,225. I think you stated that you pursue the same system as Mr. Briggs, and make the soap yourselves?—Yes, we do.

14,226. Do you make it caustic?—Yes.

14,227. Do you use potash and soda?—Both. I think we buy soap as well.

14,228. How much oil do you buy in a week?—I think we buy a ton of oil in a week, or perhaps more.

14,229. You use a ton and a half of grease. How much do you get back?—I cannot say from memory, but I think it is from one to two tons a week of different material.

14,230. What do you sell it for?—About 17*l.* or 18*l.* a ton, but I am speaking entirely from memory. Then there are the expenses. I think we make something like from 200*l.* to 300*l.* a year profit out of the process.

14,231. (*Chairman.*) You convert so much of it into useful material?—Yes, every ounce of it that we can, but we cannot treat all the waste liquid so.

14,232. (*Professor Way.*) What did Messrs. Teall pay you for the right of extracting grease?—I think they paid us 5*l.* a ton, but then we found the steam.

14,233. Then you got nearly as much profit as you do now, without the trouble, except that you found the steam?—Yes, we found the building and all the apparatus.

14,234. Then they gave you nearly as much as they could afford to give you?—I suppose so, but we would not allow it to be done any more.

14,235. If you only make 300*l.* a year now, and you use a ton a week, at 5*l.* a ton they would have paid you 250*l.*?—I do not think there was so much as a ton a week.

14,236. The difference between what you paid and what you make now may be considered as their profit?—Yes, I consider that we make 100*l.* more of it than we did.

14,237. Do you treat all the soap liquor?—Yes, the whole of it from the works which are in a position to admit of the liquor running into tanks. At one portion of the works we cannot get the soapsuds into tanks, and those soapsuds go into the stream, and have done so for 50 years past.

14,238. As you arrive at the last part of the process of washing the wool and the worsted, the water, I suppose, gets tolerably pure. Does it all go through the process for grease extraction?—Yes, all of it.

14,239. Not merely the best part of the waste liquor but the whole of it?—Yes, it can go no other way but through the tank.

14,240. When it is collected there, and acids are added, a settlement takes place, and a scum is formed?—Yes, it is broken with sulphuric acid.

14,241. Is the liquid tolerably clear?—It is not clear when it runs away. We run it on to filtering beds.

14,242. Does that operation clear it?—Yes.

14,243. What passes away?—It is the liquid, after the grease has been broken.

14,244. I suppose there is still some grease in it?—Yes, we do not get all the grease out.

14,245. Do the ashes after a time block up?—Yes. We have large tanks about the size of this table, and the depth of the area filled in with ashes is twice the size of this table. The tank is 16 or 18 feet long, about two yards wide and one yard deep.

14,246. The tanks are filled?—Yes, and whenever the liquid is let out from the grease-house tanks it runs through pipes on to filtering beds, which are beds of ashes of considerable thickness, from about 12 to 15 feet thick, of solid ashes, which we take from the engine-boilers.

14,247. How do you get those ashes into the tanks?—The tanks are made in the ashes.

14,248. How long will it be before these ash-beds choke?—We clean them out perhaps once a month.

14,249. Do you keep up the same sides to them, or do you make new ones?—No, we just clean them out. The sides stand; we clean them out, and then we throw the stuff on to the side, and lead it to the land about once a month.

14,250. Is the water that comes away tolerably clear?—As clear as gin, quite clear.

14,251. What quantity of acid do you use in the course of a year?—I cannot speak to that.

14,252. Do you use oil of vitriol?—Yes.

14,253. Do you know the quantity of wool that you wash in a year?—We wash about 120 packs a week.

14,254. How much soap do you buy?—About 12 packs a week.

14,255. Including what you make?—Yes, what we make with the oil.

14,256. If it could be shown by the figures you give that you do not get all the grease out, I suppose if it could be done it would be worth doing?—Yes, and we should be very glad to do it.

14,257. Do you use the grease over again?—No.

14,258. You do not make soap of it again?—No.

14,259. Supposing you used a certain quantity of soap, containing so much grease, and a certain quantity of oil, every week, do you fancy that you get anything like that quantity back again in weight?—I should think not.

14,260. (*Mr. Harrison.*) You say that the water comes away from the ashes very bright and clear, but do you find that nearly the same quantity passes away into the brook as you used in the first instance?—No, because there is very great evaporation in the boiling tanks.

14,261. Afterwards, in passing through the filtering beds, is there much loss from evaporation?—Yes.

14,262. In some places the quantity of water taken from a brook for such purposes affects the power at the mills below, and the millowners below are very tenacious of any abstraction of water which is not returned to the brook. As affecting the question of water power, what may be the loss between what you take out and what you restore to the brook?—I could only make a mere guess.

14,263. I presume the quantity must be very much diminished?—Yes, there is no question about that. It is used in the steam engines as well as in the boilers.

14,264. The Doe Park reservoir is not I believe on your stream?—No, the water from that goes into the Harden Beck, a little below the point where our stream goes in.

14,265. (*Chairman.*) You were defendant I believe in the recent suit of Ferrand v. Townend?—Yes.

14,266. What was the cause of the proceedings in that case?—The plaintiff alleged that I polluted the stream by letting the water out of the Cullingworth reservoir.

14,267. Do you mean the reservoir where you impound the water?—Yes.

14,268. The pollution was caused by letting out the mud?—Yes.

14,269. Was the complaint confined entirely to pollution by mud?—Ultimately it was so. He alleged that it killed his fish.

14,270. How has that suit terminated?—We have got all our rights, but we have been saddled with costs I am afraid.

14,271. Did not that case involve the question of polluting the stream by soap waste?—That question was brought in in the proceedings, but it ultimately turned almost upon the point I have mentioned, the flushing of the reservoir.

14,272. When was judgment pronounced in that case?—About three weeks ago.

14,273. At what date?—I cannot say.

14,274. What is the effect of the decision?—The effect of the decision is that we are to treat the stream as we had hitherto done up to 1864, and that is as much as we ever wished to do.

14,275. But I suppose you are not again to flush the reservoir into it?—Yes, we are.

14,276. And to foul the stream again?—Yes.

14,277. And to kill the fish again?—Yes.

14,278. Was the great point in this case that you allowed a large quantity of mud to collect, and you then sent it down in a large body, and is this the result, that you are to be permitted to flush it from time to time more frequently, instead of at longer intervals?—There is no restriction put upon us whatever, but that we are only to do what we had done up to that time. We had been accustomed for 50 years to flush the reservoir out every year, and we had always done it at what is called "Bingley tide," that is at the time of a holiday.

14,279. (*Professor Way.*) How long have you been in the habit of filtering the water through ashes after separating the grease?—Ever since we began the operations, six or seven years ago.

14,280. Did you discontinue that practice at any time?—No.

14,281. Was not that one of the complaints made by Mr. Ferrand?—I think not.

14,282. Not that you had left off doing something which you had done before to purify the water?—I think not.

14,283. (*Mr. Harrison*). Is the mud which you pass out from the reservoir brought down the stream from above your works?—Yes.

14,284. It does not come from your works?—Not at all. A great portion of it comes from the sewage of the village and some tanyards and collieries above us. Those remain, and in 12 months our reservoir will be 18 inches deep in mud, but we do not put an ounce in ourselves.

14,285. (*Chairman.*) Before whom was this suit tried?—Before Sir John Stuart.

14,286. At what date?—About three weeks ago.

14,287. Have you any idea what the cost of that suit was to you?—No.

14,288. (*Mr. Harrison.*) You have been put to this expense in consequence of nuisances caused by persons situated above you. If there had been a law to prevent them passing sewage into the beck, your reservoir would not have been polluted, and you would not have been subjected to a lawsuit?—That is so. A great deal of pollution comes from the roads as well as from the cottages in the village, and ashes that are washed off the roads.

14,289. (*Chairman.*) Do you know whether it is the practice of any manufacturers on any parts of the stream above you to put ashes into the becks?—There are no mills above us.

14,290. Are you at all affected by floods?—Yes.

14,291. Do tanners put any waste materials into the streams?—Yes.

14,292. Does that practice injuriously affect the water for your purposes?—Yes.

14,293. Have you had any difficulty with tanners with regard to pollutions?—We have remonstrated with them, and one of them has given the practice up now.

14,294. Is there any person below you who is liable to be affected by your operations?—Yes, there are some mills below us, between Cullingworth and Bingley, worsted spinning manufactories.

14,295. Do they use the water as you use it?—Yes.

14,296. Have you had any difficulty with them about the water?—When we let out Ellar Carr dam, soon after we bought it, there was a deal of mud in it, and it filled up our neighbour's dam, and he said that we ought to help him to defray part of the cost incurred in getting it out again.

14,297. Did you do so?—Yes, we did. We were disposed to be friendly with our neighbour, and did not wish to go to litigation.

14,298. Have you formed any opinion as to whether it is advisable to have any sort of conservancy for the management of rivers and streams, to prevent pollution and to settle disputes without great cost?—Yes, and I think it would be well if it could be arranged.

14,299. Do you think that there might be an arrangement so that any difference between neighbours,

KEIGHLEY.

Mr. E. Townend.

28 Nov. 1866.

as between you and Mr. Ferrand, for example, might be settled without great costs?—Yes.

14,300. Is there any tribunal with more simple machinery that you might have gone before to settle the matter?—I should think there is, certainly; a common action would have been much more simple.

14,301. How long were those proceedings pending?—They began in 1864.

14,302. And you only obtained a decision three weeks ago?—That was about the time.

14,303. You were in litigation for two years?—Yes.

14,304. (*Mr. Harrison.*) Do you think it would be any hardship to call upon all manufacturers to purify their soapsuds to the extent that you do?—Not at all. I consider that it would be a benefit to them.

14,305. Not merely the first process, as practised by Le Page and Company, but the second process of filtering the soapsuds through ashes?—Yes; but I do not think there is any profit to be made by the second process.

14,306. Can it be done without actual loss?—I think there is a loss in it, because we do not get as much tillage by it as the labour is worth.

14,307. (*Professor Way.*) But the stream would be benefited?—Yes, considerably.

14,308. (*Mr. Harrison.*) It would be no hardship to call upon all manufacturers to do the same as you do?—No, it would be a benefit to them if they had convenience for it, it depends a great deal upon that. We are well situated, and have laid out much money.

14,309. (*Chairman.*) You have striven to keep your own premises in good order, and to keep the stream pure?—Yes.

14,310. Do you think you have succeeded?—Yes; we have done it for the sake of profit and our own convenience. We have land below, and we do not want to foul the stream.

14,311. Yet you have been punished in the shape of law costs more than many men who pollute the streams much worse?—Yes, ten times worse.

14,312. (*Mr. Harrison.*) You have suffered from the pollutions of others?—Yes. I wish to add this, that the streams in our neighbourhood are more polluted from other sources than from our works. I mean by refuse from cottages, and by the general drainage of the country roundabout, and from the roads. We do not put five per cent. of the pollutions into the stream that we did 30 years ago.

14,313. (*Professor Way.*) Do you think that that is commonly the case with manufacturers?—By no means.

14,314. (*Mr. Harrison.*) Would the water that issues from your ash filters be suitable for the purposes of the mills below you?—Yes, certainly, for any purpose whatever, for dyeing.

14,315. (*Professor Way.*) Do the ashes make the water hard?—I am not aware that they do; we have had the water analysed.

14,316. (*Chairman.*) What kind of dye do you use?—We only dye blacks.

14,317. Do you use indigo?—No.

14,318. (*Professor Way.*) Do you dye with logwood and campeachy?—Yes, and copperas.

14,319. Does the dye waste pass through ashes as well?—Yes.

14,320. Does the water come away clear?—Yes. That we have done for a few years back; we used to put it all into the stream, but not since 1854.

14,321. Is that waste filtered in the same filter beds?—No, the soapsuds and dye waste are kept separate from each other.

14,322. Is the bed raised very considerably by that dye waste?—No; we clean out the filter for the dye waste just the same as the other filter.

14,323. But I suppose there is a good deal more refuse to clean out?—No; we mix the refuse up with the ashes for the land, although we do not think there is any great value in the mixture so produced.

14,324. Has the dye waste ever been tried by itself?—I do not know.

14,325. Does it not contain a quantity of iron?—

14,326. Is not that injurious to land?—I do not think it is, but we have never tried it separately.

14,327. I suppose that stuff is much of the same nature as the dye that is fixed in the cloth itself?—I think so.

14,328. It is not worth anything for any practical purpose?—I believe not, but we have never tried it; we never thought there was any value in it; we never tried the liquid upon the land.

14,329. Does the water run away quite clear from the beds?—Yes. I suppose that we can turn it into the stream after the decision that was pronounced, if we like.

The witness withdrew.

Mr. T. B Laycock.

Mr. Thomas Brigg Laycock (Keighley) examined.

14,330. (*Chairman.*) You are a worsted manufacturer?—Yes.

14,331. Where are your works situated?—At Bingley.

14,332. You are a member of the Bingley Improvement Commission?—Yes.

14,333. What number of hands do you employ at your works?—About 200.

14,334. Are your works situated upon any stream or beck?—They adjoin the canal.

14,335. What canal?—The Leeds and Liverpool Canal.

14,336. Do you get your water from that canal?—Yes.

14,337. Do you use engine power?—Steam power.

14,338. What weight of coal do you use in a year?—Taking the year round, about eight tons per week.

14,339. What becomes of the ashes?—They are led away.

14,340. At what cost to yourselves?—I do not know. I keep a horse, and I have them led away for 1*s.* 6*d.* a week, or 6*d.* a cartload; we have convenient places near.

14,341. What kind of accommodation have you for your hands?—We have privies outside the building, with doors opening into the interior.

14,342. What becomes of the refuse?—It goes into a cesspool, and we lead it away in barrels about once in three weeks, when the cesspool is full. We mix the refuse with gravel or soil, and use it as manure.

14,343. What volume of water do you use on your premises?—I do not know.

14,344. Where do you get it from?—The canal.

14,345. What do you pay the owners of the canal for it?—6*l.* a year, and we turn the water back into the canal.

14,346. Do you use any soap?—No; we do not pollute the water.

14,347. You take it out and use it for engine power and send it back again?—Yes.

14,348. Is there any water supply for Bingley?—We have a supply now, but previously to 1862 water was supplied by Mr. Ferrand solely. In 1862 the Commissioners purchased the right of Mr. Ferrand, and agreed with him for 30 years' supply of water, 10 years at 500*l.* a year, and 20 years at 600*l.* a year. That agreement is now in operation. For the construction of these waterworks the place is rather convenient. We have seven springs in three different directions, but we are not obliged to carry the works through any other person's property except Mr. Ferrand's. The arrangement is between him and the Commissioners, and is free from difficulty.

14,349. What is the population of Bingley?—About 6,000.

14,350. What is its rateable value?—I think about 10,000*l.*

14,351. Is Bingley sewered?—It is.

14,352. Where do the sewers empty themselves?—Into the river Aire.

14,353. Has there been complaint made by anyone of a nuisance having been caused by that?—I do not know that there has been. Mr. Ferrand has mentioned the matter to me. I should mention that we have made a tunnel (for it is very peculiar ground for drainage, in fact the worst possible ground, for it has high and low levels), there is a plot of over three acres adjoining the canal, and this ground is lower than the canal bank, it fronts the canal for 240 yards, and one-third, I should say, or one-fourth of Bingley drains into this place. The main sewer runs down along the canal bank, and when it was open in the summer time it was not fit for anyone to pass along the canal bank; it was an open cesspool and exposed to the weather. The Commissioners took the matter up, and they made a drain under the town, which cost something like 1,100*l.*, which has now taken all the refuse away.

14,354. You have removed that evil by conducting the sewage direct into the river?—Yes, it went into the river before, but in a circuitous and objectionable way.

14,355. I suppose floods do not affect you?—Very little; the recent flood affected the corn mill at the side and a cottage or two.

14,356. Have you observed the effect of the flood in the valley?—Yes.

14,357. Was it very destructive?—In Bingley Vale there is not much damage done except in some places the river washed a little wider.

14,358. Have you paid any attention to the floods since you have resided here?—Yes, within the last seven years, I have always lived here, and I know something of the floods.

14,359. Can you draw any comparison between the recent flood and other floods which you have seen?—I should say that the last flood was the greatest I ever saw. When Mr. Brigg gave his evidence here he referred to a flood at Stockbridge 29 years ago. I remember very well the carriage of Mr. Hall, a solicitor in this part, who was going to be married, going through the water at Stockbridge. I do not think the water had ever crossed the road from that time until now.

14,360. Did it come across the road on the recent occasion?—Yes.

14,361. Are you aware that a weir has been taken down there which has lowered the river four or five feet?—Yes, and I should say that the flood would have been much deeper at the crossing of that road if the weir had not been taken down, and the bridge would have been in great danger. I was there a little after the bridge gave way.

14,362. Is the bed of the Aire filled up at all below Bingley?—I should think that it is not much filled up. I think that any refuse that may be thrown into the river above Keighley would assist in filling up the river before it got to Keighley. We have a weir about a mile from Bingley called the Castlefield weir, and that weir I think would stop anything coming down.

14,363. (*Mr. Harrison.*) Between the river Worth and that weir is the bed of the river altered much?—Yes, it is raised much at one point, I think it has risen a yard, but that is on account of the current, and of course the refuse must settle somewhere, it cannot go down below Bingley.

14,364. Has that rising of the bed of the river caused the flooding to be greater than it used to be?—Yes, and also the quick current has had that effect.

The witness withdrew.

The witness subsequently added to his evidence the following statement: As a proof that Bingley sewerage does not foul the river injuriously to health, within 300 yards of the centre of the town and the outlet into the river Aire, there are a quantity of trout. I have asked two old fishers, and they tell me there never were more; one man said there were thousands of trout, and the other said the water almost lifted with trout. It is preserved by Mr. Ferrand.

Mr. John Clough (Keighley) examined.

14,365. (*Chairman.*) In what business are you engaged?—I am a worsted spinner and manufacturer.

14,366. You represent the firm of Robert Clough and Company of Grove mill, near Keighley?—Yes.

14,367. Do you use steam or water power?—Both.

14,368. To what extent do you employ water power?—The extent is not ascertained, it is very irregular.

14,369. What quantity of coal do you burn in a week?—On the average about 25 tons a week.

14,370. What do you do with the ashes?—Within the last three years we have used them in building operations.

14,371. Do you grind them with mortar?—We use the largest for making roads, and the smaller for mixing with lime, only the remnant we put away into the stream.

14,372. Do you put any into the stream now?—Very few.

14,373. But you do occasionally?—We have put in very few during the last three years.

14,374. Do you use water in your manufactures?—Yes, for washing wool.

14,375. To what extent?—I cannot tell that, but we have plenty of it.

14,376. Do you take it from the beck?—No, from our own reservoir.

14,377. Of what area is that?—Perhaps it has a surface of an acre and a half.

14,378. Of what depth?—The average available depth is six feet.

14,379. Is it spring water?—No, river water.

14,380. Do you catch it from the stream?—It is taken at the dam stones.

14,381. How often do you cleanse the reservoir out?—Sometimes we do not do it for two years.

14,382. When it is done is the refuse flushed into the river?—Yes.

14,383. Has any person below you ever complained of that?—They have complained just at the time after we have been flushing, if they have been working, the refuse has got into their pump and stopped their machinery for a time.

14,384. How many hands do you employ?—About 320.

14,385. Have you provided privies or waterclosets for their accommodation?—Privies.

14,386. What becomes of the refuse?—The privies are in rows on one side and the other, the sewage is taken down through an iron pipe into a waggon or box which is on wheels, and then it is carried away to the land and mixed with the soil.

14,387. Does any of that refuse go into the stream?—Not a drop of it that we know of, we use it on the land.

14,388. Has the bed of the stream been raised since you remember it?—I consider that it is half a yard lower opposite to us than it used to be.

14,389. Is it lower before you have cleansed the reservoir out?—Yes, by the natural washing of the stream.

14,390. Is that the case all through the town of Keighley?—I cannot give any evidence about the town.

14,391. But it is lower opposite to your works?—Yes.

14,392. Have you suffered by the recent flood?—Yes, we have.

14,393. In what way?—Our fires, or at least our

KEIGHLEY.

Mr. J. Clough.

28 Nov. 1866.

flues, were filled up about 9 o clock on Friday by that flood, I mean the flue under the boiler going to the chimney.

14,394. And the water stopped the machinery?—Yes.

14,395. How long did you stand still in consequence?—We stood still all that day, but in the afternoon the water ran over our dam bank, and through our boiler house; but we attribute the first four hours of our standing still to the bridge that has been made by the Keighley and Worth Valley Railway Company—a timber bridge standing on piles driven into the mid stream with no allowance for the piles.

14,396. You think that that bridge or viaduct backed the stream up, and caused you to be flooded?—Yes, from two to three feet, that was just the difference it made in our case.

14,397. Have you remonstrated with the company?—Yes, we did at once.

14,398. What have they said?—Nothing yet.

14,399. Have you any idea of making them pay for the damage they have caused?—We have given them notice to that effect.

14,400. Did you notice what they were constructing when they were putting the bridge up?—Yes, we remonstrated with them at the time.

14,401. Did they not take any notice of that?—The engineer in chief said that they would allow waterway for the piles, but they never did.

14,402. If you have been flooded in consequence this time, you will of course be liable to be flooded again?—Yes, by a similar flood.

14,403. Was this a greater flood than you ever remember before?—Yes, I never recollect such a flood.

14,404. (*Mr. Harrison.*) Do you wash wool in the way that Mr. Townend mentioned?—We use the same system partially, to the extent of half our operations; for the other we use soap, the ordinary marketable soap.

14,405. What do you do with the soapsuds?—At the present time we turn them into the stream, but we have built a new mill recently, and a building to extract the suds on the same system as Messrs. Townend pursue.

14,406. Do you think you will carry it out as effectually, so as to send the water away from your premises in a pure state?—I have heard Mr. Townend's evidence, and I scarcely think that we have room for the sort of filter bed that he mentioned. I have not seen his filter beds, but I did see the soap beds. We have neither space nor fall for the filter beds.

14,407. (*Chairman.*) How many packs of soap do you use in the week?—Five.

14,408. (*Mr. Harrison*) In cleansing what weight of wool?—Between 50 and 60 packs per week.

14,409. How much soap and oil do you use?—We use five packs of soap, and we use in alkalies and oil equivalent to five packs of soap.

14,410. Do you dye as well?—Not at all.

14,411. If it can be shown that a filtering arrangement similar to that which is carried out by Messrs. Townend could be used, occupying only a small space, would it be any hardship to you if you were compelled to filter all the water as he does, and pass it away pure?—We should not consider it a hardship. I think it would make it necessary for us to pump the soapsuds up to a filter bed, but if everybody above us sent the water down pure, we should not make any objection.

14,412. Would not the advantage of getting clean water for cleansing be greater than the injury of being obliged to pump the soapsuds up?—We have occasionally experienced a very disagreeable smell, which we have attributed to letting the liquid out of the sud tanks above us, it was a peculiar smell, and it got into the mills occasionally; but the volume of water is so great that comes down the stream, that we have not found the pollution to affect our wool-washing operations, the smell is only disagreeable occasionally, and I have not noticed it lately, but the last summer has been wet.

14,413. (*Chairman.*) You might observe it more in a dry summer?—Yes, if the soapsuds were turned into a very small stream.

14,414. (*Professor Way.*) I suppose you would say generally that purification of the streams is so much to be desired, that it would be worth while for each manufacturer to incur some expense to accomplish that object?—I think it is very desirable, and we should not object to take our share in keeping the water pure, and keeping all solid materials out of the stream.

14,415. And as far as you could in preventing pollution from wool washing?—Yes, we are preparing to extract the bleach.

14,416. The proper plan I suppose would be for each manufacturer to refrain from polluting the stream?—Yes, I think so.

14,417. Prevention being better than cure?—Yes. It appears, as far as the worsted manufacture is concerned, that prevention is a means of profit, the extraction at least of the soap is a profit.

14,418. In making that profit, it would be fair nevertheless that you should be asked to discharge the liquid as pure as you could, even if it should diminish your profit?—Yes, if everybody above us did the same; I think we should derive a certain benefit from receiving the water purer, although it seems pure enough.

14,419. You probably heard Mr. Townend say that without filtration the liquid, after it comes from the grease separating process, still comes in an objectionable condition, but filtration through a bed of ashes sends the water away in an unobjectionable condition?—Yes.

14,420. That of course would be attended with a diminution of profit, because filtration would cost money?—Yes.

14,421. May it not nevertheless be said that a diminution of profit would be quite a tolerable thing if you gain an advantage in the end?—Our circumstances are different. Messrs. Townend's premises are situated on a very small stream, while we are on a large stream, and the quantity of turbid water that is turned out from our works bears a very small proportion to the whole volume of the stream, whereas in Messrs. Townend's case, it bears a larger proportion. In my opinion the simplest course to pursue is to stop out all impurities.

14,422. And you would not object to a general law to effect that purpose?—I do not think we should.

(*Mr. Townend.*) I may remark that our stream is so small that in the summer time all the sewage lodges in the brook, and there is not a sufficient flow of water to take it away, there is scarcely a run at all from the cottages or the ditches, all refuse is taken away with the first flood that comes.

14,423. (*Professor Way to the witness.*) Can you state what quantity of oil you use?—I cannot state it off hand, 132 lbs. of oil represent a pack of ordinary soap, such as we use.

14,424. The compound is nearly half oil, is it not?—Yes.

14,425. Is it the oil that you expect to recover?—I was wrong in the figures. I should have said 84 lbs. of oil are used in 256 lbs. of soap.

14,426. That would be about one-third?—Yes, that is to say, we should use 84 lbs. of oil where we used a pack of soap under the old system.

14,427. Supposing you were paid as Mr. Townend was by a company for the right of extracting the soap, you would be paid I suppose for 84 lbs.?—Yes, we should reckon on 84 lbs of oil.

14,428. Out of a pack of soap, or its equivalent?—Yes.

14,429. Is that the only oil that you use?—No, we use oil in combing the wool, oil is put on to the wool.

14,430. Are the goods washed afterwards?—Yes, but that is after they leave us. We wash some of our yarns, or scour them, and the warps, the double warps, we scour.

14,431. (*Chairman.*) Do you use urine in any of your processes?—No.

14,432. Is it used in the Keighley trade?—Not that I know of. I have heard of its occasional use for very dirty warps.

14,433. Is there anything of the kind used, such as pig dung, or refuse of that kind, in the woollen manufactures?—They are not at all suitable for our trade. We do not use the short fibres that are produced in the combing operation, they have to be sold for another purpose.

14,434. Do you dye?—Not at all.

14,435. (*Mr. Harrison.*) Do you use any foreign wool?—No, we use no foreign wool.

14,436. What loss do you sustain in cleansing the wool?—In fine English wools we lose as much as 3 lbs. out of 16 lbs., the average loss is from 2 lbs. to 3 lbs.

14,437. Do you use Scotch wools?—Not at all.

14,438. (*Chairman*) What is the price of that class of wool at the present time?—From 1*s.* 7*d.* to 2*s.* 2*d.* a pound.

14,439. What is the ordinary price?—I cannot say.

14,440. Has wool increased in value recently?—It is very much higher than it was, but still it is lower than it has been.

14,441. Did the cotton famine cause the price of wool to rise?—Yes, it sprung up to 2*s.* 10*d.* instead of 2*s.* 2*d.*

14,442. Lancashire suffered by losing its trade, but Yorkshire was benefited by having an inland trade?—So it would appear.

14,443. As the supply of cotton got smaller the price of wool became higher?—Yes; the greatest variation in price that I ever knew of was from 1*s.* 0½*d.* a pound for the same class of wool to 2*s.* 10*d.*, and that was in Yorkshire hogs.

14,444. At what period did that alteration take place?—I think the price of 1*s.* 0½*d.* was just about the close of the Crimean war in 1854; we then had a severe depression in trade, and wool went down to that price.

14,445. At what time did it get up again?—It got up about two years ago.

14,446. In 1864?—Yes.

14,447. What would the price of the same wool be now?—About 2*s.* per pound.

14,448. Is there anything further you wish to add?—I forgot to mention that the piles of the railway bridge stopped five trees that were coming down; the bridge is on a curve, and the trees turned and drifted against the piles and stopped there.

14,449. Did that cause a flooding of your premises?—Yes, and in one room that we never anticipated.

14,450. Did that cause you much injury?—It injured the material, but we got the most valuable portions of it out.

14,451. To what extent do you consider you suffered in money value?—We do not know; we are drying the wool and repacking it to this day.

14,452. Will you apply to the railway company for compensation for the damage they have caused you?—Yes, that is what we think of doing.

14,453. (*Mr. Harrison.*) Do you mean a railway bridge that is near to the station?—No; it is on the Worth Valley Line.

14,454. (*Chairman.*) What is the name of the railway?—It is called the Keighley and Worth Valley Line; it belongs to an independent company.

The witness withdrew.

Mr. Edward Marriner (Keighley) examined.

Mr. E. Marriner.

14,455. (*Chairman.*) You represent the firm of B. and W. Marriner, worsted spinners, at Keighley?—Yes.

14,456. Where are your works situated?—On the river Worth.

14,457. What number of hands do you employ?—About 400.

14,458. What weight of coal do you burn in a year?—About 1,300 tons.

14,459. Do you use water power?—Yes.

14,460. What do you estimate the power to be?—The nominal power is 40-horse.

14,461. Can you work at that rate?—Not all the year round.

14,462. How long has the wheel been in use?—A great number of years.

14,463. Is it as serviceable to you now as when it was first put up?—No.

14,464. Has the tail-goit been choked up?—No; I think that less water comes down the river.

14,465. In consequence of the reservoirs that have been constructed?—I do not know.

14,466. Were you at all affected by the late flood?—Not very much; we are rather away from the course of the river.

14,467. Do you use water in your manufacturing processes?—Yes, for washing wool.

14,468. In the same way that the last witness stated he did?—Yes.

14,469. Do you dye at all?—No.

14,470. Do you use soap and oil?—Yes.

14,471. What weight do you use per annum of soap?—Nine or ten packs a week.

14,472. What quantity of oil do you use?—I do not know.

14,473. Do you recover waste refuse from the soap suds?—Yes.

14,474. Do you perform that operation yourselves?—No, we lease it to someone else.

14,475. Do they take the refuse away?—Yes.

14,476. They do not treat it on your premises?—No, they mix it up and take it away.

14,477. What do they pay you per annum for it?—I cannot say, but it is so much per pack.

14,478. How much per pack do they give you?—I do not know, 3*s.* or 4*s.*

14,479. Have you provided privy accommodation for your hands?—Yes.

14,480. What do you do with the refuse?—We use it for manure.

14,481. It does not go into the stream?—Not at all.

14,482. Is the water that comes away very dirty?—No, I do not know that it is.

14,483. Are there manufactories situated below you?—Yes.

14,484. Have any complaints been made of your polluting the stream?—No.

14,485. Have you complained of any persons above you for doing so?—No.

14,486. What do you do with the ashes?—They are carted away to repair the roads.

14,487. Do you ever put any of them into the stream?—We have not done so for the last 10 years.

14,488. Do any persons above you put their ashes into the stream?—I suppose so, but I do not know.

14,489. Do you think that the bed of the stream has been raised opposite to your premises?—I do not think it has very much.

14,490. How long have you known this stream?—Four or five years personally.

14,491. Do you remember a flood before the last flood?—No.

14,492. How long have you recovered the refuse from your soap and oil?—I should say six or seven years. I cannot state exactly.

14,493. What weight of wool do you treat at your premises?—About 80 packs per week.

14,494. Into what is it manufactured?—Into yarn.

14,495. Where is it worked up? In Bradford?—We only spin, and it goes away to Bradford; it goes abroad from there.

14,496. What wool do you use?—English and foreign.

14,497. Where does the foreign wool come from?—From Port Philip and Van Diemen's Land.

14,498. Do you use more Australian than English wool?—We use more English.

14,499. Do you use them separately, or do you mix them?—We use them separately.

14,500. (*Professor Way.*) Is the water which comes away from the grease process clean?—No.

14,501. Have you tried any method of making it clean?—No.

14,502. Who are the people who treat your grease; is it Le Paige & Co.?—The people in the town here take it, namely, Listers.

KEIGHLEY.

Mr. E. Marriner.

28 Nov. 1866.

14,503. Do you supply steam for the tank?—Yes, we pump.

14,504. Is the liquid treated?—No.

14,505. (*Chairman.*) In washing your wools have you much loss in weight?—Yes.

14,506. About what proportion of loss have you in your English wools?—From 3 lbs. to 4 lbs. in 16 lbs.

14,507. And what in your Australian wools?—From 5 lbs. to 6 lbs.

14,508. Is the loss owing to the dirt which is washed out?—Yes, and grease out of the wool.

14,509. Then the Australian wools come to you dirtier than the English wools?—Yes, they are more greasy.

14,510. And you lose more in weight?—Yes.

14,511. Did you ever hear of the process by a French patent of getting carbonate of potash out of wools in the first washings?—No.

14,512. What do you do with the water in which the wools are washed at first?—It goes into the tank.

14,513. That is the water from which you extract the grease?—Yes, the whole of it goes in; parties take it all, and the spare water goes into the beck or river.

14,514. If it could be shown to you that you could clarify that water to a certain extent by an ash filter, such as you have heard described by Mr. Townend, should you have any objection to try the process?—I should think not; it depends upon the cost.

14,515. (*Professor Way.*) You would object still less, if you could do it in less space than that which an ash filter takes up?—Yes.

The witness withdrew.

The witness subsequently informed the Commission that, according to the opinion of the elder workmen, the bed of the river Worth had been raised at least 12 inches in the last 10 years: the personal observation of the witness being as stated in answer 14,489.

Mr. R. N. Sugden.

Mr. Robert Newsholme Sugden (Bingley) examined.

14,516. (*Chairman.*) You are a worsted spinner?—Yes.

14,517. Where are your works situate?—About three miles from Keighley, up the Worth valley.

14,518. In the Bingley district?—In the parish of Bingley.

14,519. What number of hands do you employ?—About 700.

14,520. What accommodation have you for your hands; have you privies?—Privies.

14,521. What becomes of the refuse?—It goes into tanks underground, and is carted away on to the land.

14,522. Do you use the water of the stream upon which you are situated?—Yes.

14,523. For washing?—No.

14,524. What weight of wool do you use per week?—We use about 100 packs a week.

14,525. What weight of soap and oil do you use?—We do not wash all the wool on the premises. We buy a good deal in the prepared state, tops.

14,526. Do you do any washing?—Yes.

14,527. And you use soap and oil?—Yes.

14,528. Do you treat the waste suds at all, so as to recover the material out of them?—Yes, we let them off to S. & C. Lister; they have the management of them.

14,529. Do they pay you so much per pack of soap?—Yes.

14,530. How much?—*3s.*

14,531. Do you find tank room on your premises?—Yes.

14,532. Do you find any steam?—No.

14,533. Is the grease extracted on your premises?—No.

14,534. Then the fluid refuse, whatever it may be, passes into the stream?—Yes, and the solid is taken away.

14,535. Do Messrs. Lister take the solid, or do you take it?—They take it.

14,536. And they do what they like with it?—Yes.

14,537. Do you use English wool or a mixture?—We use both English and foreign.

14,538. Do you use Australian wool?—We do not use very much Australian wool. Our principal weight is English wool.

14,539. Do you use any Scotch wool?—No.

14,540. About what is your loss in weight in washing English wool?—It will vary a little according to the cleanness of the wool. The loss is perhaps 2 lbs. or a little under 3 lbs. out of 16 lbs.

14,541. And what is the loss in washing foreign wool?—We do not wash foreign wool; it comes in a prepared state.

14,542. Where does it come from?—It is Australian wool.

14,543. Do not you use any continental wool?—A little.

14,544. In what state is the river now as compared with what it was when you first knew it?—I should think that it is somewhat similar.

14,545. Is the water of the river polluted when it comes to you?—More than it was formerly.

14,546. What mills or manufactories are there above you?—I cannot exactly state the number, but a good many.

14,547. You are on the Worth?—Yes.

14,548. Is the Worth a tolerably large stream?—It is a very good stream.

14,549. Did the flooding the other week injure you at all?—Not very much.

14,550. Was it as large a flood as you remember?—It was larger than I ever remember.

14,551. When we commenced our inquiry all our evidence went to this, that the floods were not so large as they had been formerly. I suppose you think that the late flood was otherwise?—The late flood was an extraordinary flood. The floods perhaps have not generally been so large lately as they were formerly. We have been at those works 23 years, and we have never seen such a flood before as the recent one.

14,552. It was not only a large flood but it was the largest which you recollect?—Yes.

14,553. Then any assertion that the floods are less than they were formerly is contradicted by this flood?—Yes.

14,554. Some people have thought that the land drainage has produced the floods?—This flood, I should think, was produced by the extraordinary fall of rain in a short time.

14,555. Do you know what height the water rose vertically opposite to you?—I should think that it rose from the bottom of the stream seven or eight feet high. I should think that that would be from 18 inches to two feet higher than we ever saw it before.

14,556. What weight of coal do you use?—That varies a great deal.

14,557. How much do you use per week upon the average?—About 35 tons a week.

14,558. What do you do with your ashes?—We use them for different purposes; for grinding up with lime, and for roads.

14,559. Do any of them go into the beck?—No.

14,560. Did you at any time put any of them into the beck?—Occasionally a few perhaps.

14,561. Do any of your neighbours above or below you put their ashes into the beck?—That I cannot say.

14,562. Have you a lodge for a reservoir attached to your works?—Yes.

14,563. Does it accumulate much dirt?—A little. We have a largish reservoir, and we have one goit which carries the stream which is parallel to the goit.

14,564. If you have any mud to get rid of it passes down?—Yes.

14,565. Are there are fish in the Worth at that point?—Yes.

14,566. Trout?—We frequently find trout in our reservoir.

14,567. They come from above?—From above and below.

KEIGHLEY.

Mr. R. N. Sugden.

28 Nov. 1866.

14,568. (*Professor Way.*) Are you not rather on a high part of the Worth?—Yes.

14,569. Therefore you are not liable to much pollution?—A good deal of pollution comes down. Gas tar comes down. I should say that it is more polluted by gas tar than by anything else.

14,570. (*Chairman.*) Where does the gas tar come from?—From the works above.

14,571. What works are they?—There are Messrs. Morrall's works, which are next to us upon our stream. Messrs. Hattersley's are upon the other stream. We are just at the junction of two streams.

14,572. And you occasionally get gas tar?—Yes.

14,573. Have you complained at all of that?—I do not know that we have.

14,574. Has it injured your goods in any way?—No, we do not find any injury from it, because we have a separate supply of water for our scouring purposes.

14,575. Do you get it from springs?—Yes, we have a reservoir for it.

14,576. Are you aware that gas can be made without passing any refuse of any sort from the premises?—It has not been done in our part of the country.

14,577. Are you aware that it can be done?—Yes, I have heard it stated.

14,578. That they can carry on the operation continuously, and never pass anything in the shape of refuse into the stream?—We do not pass gas tar into the stream.

14,579. Do you make gas yourselves?—Yes.

14,580. And you do not pass any of that refuse into the stream?—No.

14,581. Nor ammoniacal liquor?—No.

14,582. Nor spent lime?—No.

14,583. Do you think that it would be justifiable to prevent these people above you from putting in any gas tar or any refuse from gas works?—It would certainly keep the water purer.

14,584. Did the floods do much damage about you?—They did considerable damage above us at one place. I did not hear of anything but at that one place.

14,585. What is the name of that place?—It is called Lumb-Foot.

14,586. What did the damage there consist of?—A reservoir burst, I suppose, at the commencement; it blew out the shed side and ran through the shed.

14,587. That was a small reservoir belonging to private works?—Yes.

14,588. Did it do the owners much damage?—I cannot state to what extent. They will find, I believe, that there was considerable damage, but I have not seen the place.

14,589. You have heard I daresay that a large amount of damage has been suffered in the valley of the Aire from top to bottom?—Yes.

14,590. Do you think that it would be a benefit to you if you could get the water cleaner than it is at present, if any regulations could be carried out by which the water should be preserved?—We use the stream principally for power.

14,591. You are not dependent upon it?—We are not dependent upon the pureness of it.

14,592. (*Professor Way.*) I suppose that you know as a fact that there are manufacturers who suffer very much from the want of pure water in the streams?—I have heard it stated so.

14,593. Do you not believe that it is so?—Of course I cannot speak to that; I only go by report.

14,594. (*Chairman.*) You are fortunately situated so that you do not suffer?—We do not.

14,595. (*Professor Way.*) It is not everybody who is high up on a stream?—Everybody is not so high up as we are.

14,596. (*Chairman.*) Nor has everybody the same advantages as to pure water?—No.

The witness withdrew.

Mr. John Dixon (Keighley) examined.

Mr. J. Dixon.

14,597. (*Chairman.*) How long have you been resident in Keighley?—Ten years.

14,598. How long have you been the certifying surgeon under the Factories Act?—Rather better than eight years.

14,599. Who is the inspector who takes this district?—Mr. Alexander Redgrave is the inspector, the sub-inspector is Mr. Rickards of Leeds.

14,600. How many mills have you under your supervision?—I generally keep the account according to the number of sets of books that I have; I certify in books. For instance, there is one mill in this town which has four firms in it; in my way of counting I call that four mills, and in that way I have about 35 or 36 sets of books, although there are not 35 or 36 mills in reality.

14,601. (*Mr. Harrison.*) But you have that number of parties with whom you have to deal?—Yes, some parties may have two or three mills, but still they are distinct so far as my duties are concerned.

14,602. I suppose that your duties do not bring you into collision with manufacturers, as regards the quality of the water or its pollution, or anything of that kind?—Not at all.

14,603. Or any interference with the river?—Not at all.

14,604. You simply certify that certain regulations are complied with under the Factory Act?—Just so.

14,605. What is the general health in this district?—I am not at present in practice myself, I have been obliged to retire from general practice on account of ill health; but I believe that yesterday you examined Mr. Milligan, and he is the gentleman who is most likely to give you the fullest information on that point, because he has made it a study. But I should say, generally, that the health of this district at the present time is about the average.

14,606. (*Professor Way.*) Do you visit the mills at any regular intervals?—Once a week, except three to which I go once a fortnight.

14,607. Is it your duty to do so?—It is my duty to do so.

14,608. Under the Act?—Yes.

14,609. You have a right of course to go into those mills at any time?—Exactly so.

14,610. Have you any other occupation?—Not at present.

14,611. If you were visiting those mills, would you have an opportunity of seeing whether any discharge of an objectionable kind was taking place from the factories into the water?—In some instances I should.

14,612. (*Chairman.*) Is Mr. Redgrave resident in London?—Yes.

14,613. At Brompton?—I believe so.

14,614. (*Mr. Harrison.*) Do you find that the conditions of the Factory Act are generally well complied with in this neighbourhood?—Yes, so far as my duties are concerned, in fact I believe that they are complied with generally. I believe that it is the desire of manufacturers in this district to comply with the Act so far as they can.

14,615. In the course of your inquiries have you to take a record of the number of hands, men, women, and children, employed in the different works?—No, the sub-inspector generally does that. I simply certify that they are of a certain age, and of good health and strength, and so on.

14,616. Do you find that the health of the people who are employed in such manufactories is pretty good?—Yes, generally speaking, I think that it is pretty good.

14,617. (*Chairman.*) Have you any further remarks to offer to the Commission?—No, I do not know that I have, except that as a medical man I think that the carrying out of the Factory Act is beneficial in many

KEIGHLEY.

Mr. J. Dixon.

28 Nov. 1866.

respects, both to the physical and the moral condition of the people. You have less of deformity, and evils of that sort, than used to prevail at one time. I think that the Act has had a very excellent effect.

14,618. And it has not been ruinous to the manufacturers themselves?—I should say not, judging by their progress.

14,619. And you do not find any factious opposition on the part of any of them to your doing your duty?—Not at all.

14,620. They are rather glad to see you than otherwise?—I hope so.

14,621. At all events they do not make it appear that you are not welcome?—No.

The witness withdrew.

Adjourned to to-morrow at 11 o'clock, at Skipton.

Skipton, Thursday, 29th November 1866.

PRESENT:

JOHN THORNHILL HARRISON, ESQ., IN THE CHAIR.

Professor JOHN THOMAS WAY.

CHRISTOPHER SIDGWICK, Esq. (Skipton), examined.

SKIPTON.

C. Sidgwick, Esq.

29 Nov. 1866.

14,622. (*Chairman.*) You are chairman of the local board of Skipton?—Yes, I am for this year. It is an annual election.

14,623. For how many years has there been a local board established at Skipton?—For eight years, from June 1858.

14,624. Have you been frequently chairman of the board?—I have been chairman for the last 5½ years.

14,625. You are therefore thoroughly acquainted with everything coming within the jurisdiction of the board?—Yes.

14,626. What is the extent of the district under the management of the local board?—I cannot tell you the area of the district.

14,627. Does it include the town and part of the neighbourhood?—It includes the town and land round about it for perhaps a mile and a half in diameter.

14,628. Can you state what the population is within the boundary of the district?—About 5,000. It is rather less than it was.

14,629. Within what period has it diminished?—Within two years, or since the effects of the American war were first felt.

14,630. How would you account for the diminution?—Business has become slack, and the poorer population have been seeking work at Bradford and other places.

14,631. What is the special business carried on in Skipton?—Cotton manufacture chiefly.

14,632. As the cotton manufacture was injured by the American war the trade of Bradford and other places was improved, and your population was taken away, I suppose?—No doubt. Wages are higher at Bradford than at Skipton.

14,633. What works have you been carrying on in the town?—We have sewered the whole town, and perhaps drained a third of it, but the house drains have not been connected with the sewers as quickly as they might have been.

14,634. Have you been introducing watercloscts generally into the houses?—The board of health are divided in opinion upon that subject. Some of them would at once do away with cesspools and everything of that kind, while others look at the cost to the owners of the houses. The result is that the cesspools have sometimes been ordered to be cleared and not to be destroyed.

14,635. Has the board of health taken in hand the cleansing of the cesspools and ashpits in the town?—No. The inspector of nuisances has power to cause any nuisance to be abated under the Act of Parliament in 24 hours, and if it is not abated he reports to the board, and then the board, or some of them, would at once order the cesspool to be turned into a watercloset. The board, however, are inclined to be easy. It is only sometimes that they will make the order. They will do so if the majority present is in favour of waterclosets, but if the majority present of the board is in favour of letting things alone the cesspool is ordered to be cleaned out by the inspector of nuisances at the cost of the parties. That is all that is done.

14,636. Has an improvement taken place in this respect since the board was established, and are nuisances removed from the town more effectually than they used to be?—In perhaps 300 out of 1,100 houses there will be waterclosets and a proper water supply for the closets. Of the remaining houses some are better and some are not better, but the town is kept in a cleaner state than it used to be. At the same time it is nothing like what it ought to be.

14,637. Do you find that there is any improvement in the comfort and health of the inhabitants in consequence of the steps you have taken?—I have no means of ascertaining. No return is made for the town alone.

14,638. What is the district for which the registrar makes his return?—Skipton Union I should think, but the registrar will be able to explain that.

14,639. Where is the sewage discharged?—Below the town, just above the railway. The volume of sewage will be 100,000 gallons a day, and we mix that in the sewers with another 100,000 gallons of water, clean water, arising from springs, which are met with in the course of the works.

14,640. Has the board taken into consideration the propriety and utility of passing that sewage on to land?—We have talked about it, and we have had a report made as to what can be done, but the cost of doing it stands in the way at present.

14,641. Is there any difficulty in obtaining land?—We do not know, but I think the difficulty will be in obtaining money. Of course we could obtain it, but then we should have to pay it back again by a rate, and as long as we cause no particular nuisance the board do not wish to incur the expense of doing anything with the sewage.

14,642. What is the rateable value of the property within your district?—7,000*l.* and some hundreds upon houses; not quite 2,000*l.* upon land.

14,643. Do the houses include the mills?—Yes, and all property which under the Act of Parliament is called a house.

14,644. Are you aware that sewage of towns is applied now in many cases, and with advantage, to land?—I have seen an account of what has been done at Croydon and Rugby and other places, and the evidence that has been given in Parliament upon the London question, and other papers on the subject I have read carefully over.

14,645. What conclusion did you arrive at?—I do not think that there is any nuisance here yet, and for this reason; 20 grains of organic matter and inorganic matter in suspension, and 20 grains of inorganic matter in solution, with 2 grains of organic matter in solution will be the state of our sewage. We turn that at once into 4 times the quantity of clean water, and the whole goes one mile with a fall perhaps of 14 inches in the mile. It then enters the river Aire, and goes 10 or 12 miles without a house near it, so that the organic matter must be oxidized and matter in suspension must be all deposited before it gets to the end of the 12 miles; therefore we do not put more than 4 grains of matter to a gallon into the

river at present. It will of course be a greater quantity when all the houses are connected with the sewers.

14,646. It is merely a question of degree. You are fortunately situated in having an abundance of water with which to dilute the sewage.—That is not all; we have also land on which we could put it, but the cost of the necessary works to get it there and preparing the land for it would be too great to incur while we are paying off the money borrowed to make the sewers. It would be too heavy a charge on the population, and therefore we think it better to avoid it as there is no nuisance to complain of yet.

14,647. Are you aware that some towns lower down are obliged to take their water from the river?—I do not know that any but the town of Leeds has ever done so. Bradford is otherwise supplied. Below Skipton there is no town on the river until you get to Bingley, and there could not be on account of the floods to which the river is liable.

14,648. Still there is a large population as you go down the river, and of course if the sewage from all the towns and villages situated on the river proper and upon the becks is turned into the river, the river must be polluted very seriously.—I agree with that, and that the sewage ought to be kept out of the river, and that where it was possible, a town population ought to be obliged to bear the expense; but I think that in a case like ours, time ought to be given, for it is a very serious expense to make sewers. Afterwards, when the money has been recovered, and the debt paid off, I think we might fairly be called upon to put the sewage on to the land, but even then all matters in solution in the water, which now contains 20 grains to the gallon, would still go into the river.

14,649. Not after the sewage was passed over the land?—No. In the Croydon report it was stated that they could not, under any circumstances, when they had passed the sewage four times through the land in Croydon, effectually extract the matters in solution At Rugby this was the case to a still greater degree.

14,650. But sewage is changed in character by being passed over land; what was noxious becomes innocuous.—Phosphorus and some other salts are taken out; but here a large quantity of iron and lime would be thrown into the water from any land that we could pass our sewage through.

14,651. You say that it is necessary to make towns keep their sewage out of the rivers and becks. If so, you could not expect that Skipton could be made an exception to the general rule.—Every private house in this neighbourhood sends filthy water into the first stream that is nearest to it. I suppose that the practice is the same throughout the whole country, and that all the villages and towns do the same; but a great deal of the matter is oxidized, so as not to be injurious by the time the liquid reaches the next dwelling-house. There are cases where single houses pollute the water for those next below them, and that ought not to be done no doubt.

14,652. Single houses must be treated in the same way as towns?—Yes. There are members on our Board who would be glad, when they could raise the money, to do something for sewage irrigation.

14,653. What other kinds of pollution are sent into the beck?—The nearest works to the mouth of the sewer are dyeworks. There are tan and lime works a little further on beyond the dyeworks, and then there are paper mills and slaughter houses, the refuse from which of course is collected into our sewers in a great measure before it is discharged at the mouth of the sewer.

14,654. Is not the blood from the slaughter-houses utilized?—It is carried into the sewers at the present time. The refuse is carted away on to the land for manure, but the liquid matter is turned into the sewers. I do not attend except merely to the general business of the board.

14,655. Is there any further information that you can give us?—With regard to the works carried out by the board of health, I know nothing more. There is land fit for sewage irrigation, but unfortunately it is the best meadow land, which we should have to take at a large price. We have no sand, but plenty of clay, and all the works would be expensive though we should not have to pump the sewage.

14,656. Could you put the sewage on to the meadow land without pumping?—Yes; by carrying it in sewers, and providing proper means for taking out the heavy materials, and carrying it a distance of $\frac{3}{4}$ of a mile.

14,657. (*Professor Way.*) Are you aware, from your reading on these subjects, that the better the land, the greater will the increase of produce be from the application of sewage?—Yes; but the less will be the profit. If you can get land at 5*l.* an acre and let t at 20*l.* an acre, good; but if you have to take other and at 5*l.* an acre and let it at 20*s.* an acre, you have lost 4*l.*; and here, if we take land at 4*l.* an acre and let it at 5*l.* an acre, we should not be better off than they are at Croydon.

14,658. Supposing the land produces crops equal in value to 30*l.* or 40*l.* per statute acre, undersewage, would the prime cost, whether it be 3*l.* or 5*l.* or 7*l.* be a serious item in the whole return?—I am no farmer, and have had no experience. I merely go by the report of the Croydon board. They said they paid 4*l.* an acre for 300 acres of land and that they let it with the sewage to Mr. Marriage at 5*l.* an acre. If they could get 20*l.* an acre they would do so.

14,659. Are you aware that the Croydon Local Board will decline in all probably to let that land again upon the same terms when the lease is ended?—I do not know that; I have not seen anything to that effect. The land at South Croydon is valuable land. It is tolerably stiff clay, which produces as good, if not better, crops than the land which Mr. Marriage has. Clay is the best purifier of sewage if you have plenty of land to lay it on. I consider that our sewage is not one-half the value of the Croydon sewage, that is to say, if the Croydon sewage is worth a halfpenny a ton, ours is not worth a farthing, on account of the larger quantity of water as compared with the quantity of sewage matter.

14,660. But the proper way of estimating the value of sewage is by the number of the population, and not by the extent of the dilution it undergoes?—Yes.

14,661. Consequently, if there are 5,000 in a population, you know at once what the value of the sewage is, independently of its dilution, and if the sewage is not to be pumped, the gross amount of dilution is not an element in the question at all?—The population of Croydon was reported in the account that I saw to be 15,000, and there was delivered 200,000 gallons of sewage per day. We turn into the brook on the dryest day 200,000 gallons, with a population of only 5,000, and if I were to say that our sewage was worth only one-third of the value of the Croydon sewage, I should not be, I think, under the mark. I take it that one-half of what is delivered from our sewers is water alone.

14,662. If you had not to pump it it would be quite easy to distribute it, and more easy to distribute a large quantity than a small quantity?—Yes. Still you have to put it on to the land. Our rainfall is 34 or 36 inches in the year. Croydon has probably half of that, and therefore, if we have 3 feet of water on the land in the shape of rainfall, and we have 9 feet more to put on in the shape of sewage, that makes a depth of 12 feet for the total quantity of liquid that we should have to filter through the land, and that would be a serious nuisance in the winter time unless we took a large quantity of land for irrigation.

14,663. There may be a difficulty in the case, but it is clear that the difficulty might be overcome?—Yes, at an expense. We do not dispute that it can be done by incurring expense. We have had plans prepared of the land, levels taken, works laid out, and an estimate formed, therefore I do not speak in the dark upon the matter. Still it would be a serious expense to us. We should want a tenant capable of working the water meadows.

14,664. (*Mr. Harrison.*) Have you observed the

SKIPTON.

C. Sidgwick, Esq.

29 Nov. 1866.

works which have been carried out in improving the river Aire between Skipton and Keighley?—I have seen parts of them as I have gone down the valley, but I have not taken much notice of them, except those close to the town.

14,665. Have those had a beneficial effect?—Yes, there is much less water now in the valley in a time of flood?—Our brook which we call the Ellar brook, which comes through the town, used to discharge into the river Aire, three quarters of a mile higher up than it does now, and in that three-quarters of a mile there is a fall, perhaps of 10 or 12 feet. Now it is carried in a straight line lower down the river, and the fall is taken up by two weirs at once, so that the brook runs in a perfectly straight line at once into the river and in consequence our valley has much less water in it in a flood.

14,666. Has any improvement taken place in the health of the people consequent upon the diminution of the floods in this neighbourhood?—I cannot say.

The witness withdrew.

Mr. R. H. Sidgwick.

Mr. Robert Hodgson Sidgwick (Skipton) examined.

14,667. (*Chairman.*) Are you a resident here?—Yes.

14,668. Have you resided here for many years?—All my life.

14,669. Are you engaged in manufactures?—I am.

14,670. In what part of the town?—Close to the Leeds and Liverpool canal and near the railway.

14,671. What business do you carry on?—Cotton spinning.

14,672. Was that business affected by the American war?—It was; seriously.

14,673. Has it revived since then?—Yes; for periods, and then it has lapsed again; the markets have fluctuated.

14,674. Do you use water or steam power?—Steam power to the extent of 40 horse.

14,675. What price do you pay for coals at Skipton?—The price of coals has been raised lately, what we term slack or small coal from Leeds, costs us about 7*s.* 9*d.* or 8*s.* per ton. the small coals from Leeds are about the same now, they were cheaper. The unriddled coals cost from 10*s.* to 11*s.* a ton.

14,676. How many years has the railway been opened to Skipton?—I think it was opened in 1847 or 1848.

14,677. How long has the canal been opened?—Since 1789 or 1790.

14,678. Did you derive any advantage from the formation of the railway in the price of coals?—It is so long ago that I cannot speak to that; I have no doubt that we did.

14,679. Did you employ steam power before the railway was made?—Yes; our mills lie by the canal which still brings coal, we principally get coals by the canal.

14,680. What do you do with the ashes?—Anyone who wants ashes for paving or for building purposes fetches them, the rest we send down the canal in a boat, and put them on the banks.

14,681. You do not turn any of the ashes into the beck?—We have none near us.

14,682. Do you send any refuse from the manufactory into the beck?—No.

14,683. How do you manage with regard to privy accommodation for your hands?—The refuse is all passed into a tank, and then it is carted away by people in the town, and taken on to land.

14,684. How many hands do you employ?—From 280 to 300.

14,685. Did you hear the evidence given just now by your brother?—Yes.

14,686. From your own knowledge can you say that he has described pretty nearly the existing state of things?—He is better informed upon the matter than I am, and I think he is pretty correct.

14,687. Can you give any evidence with regard to the fouling of the stream here?—No,

14,688. Are you at all affected by its being fouled by other persons?—No, not at all, personally we do not pollute the stream. My brother mentioned correctly that there are certain persons who turn all their waste water into the beck.

14,689. Where are the paper mills?—They are higher up the same stream.

14,690. Above the town?—Near the castle, that is, on a line with the castle.

14,691. Is there much pollution or objectionable matter sent from the paper mills into the river?—I should say not. I never heard it mentioned as a nuisance. No doubt they do turn out their waste, but I never heard it complained of.

14,692. Are there any fish in the beck here?—I am not prepared to say.

14,693. Are there fish in the Aire?—Yes; very good trout, I believe. The Aire for some miles below the entrance of the Skipton bed has been preserved for 20 years, and is, I believe, still preserved.

14,694. Do you agree with your brother that if any measure is passed calling upon the towns below to keep their sewage out of the rivers and becks Skipton should be obliged to follow the same law?—I think it is evident that it would be for the benefit of the country at large to keep the streams quite pure, but I think other nuisances might arise from sewage irrigation.

14,695. Are there any pollutions in Skipton, such as cause an objectionable nuisance to the inhabitants?—I do not know of any.

14,696. No bad smells arising from them?—In the summer time there are bad smells arising from the brook, but that is partly caused in this way. There are mills situated higher up the stream, and the small supply of water that comes down in the summer months is reserved in the dams above. There is a bad smell from the brook in a summer's evening.

14,697. From what mills is that refuse sent down?—I am speaking of the brook generally below the town. After you pass the railway the smell might be observed, but that is below the sewage outlets of the whole town.

14,698. (*Professor Way.*) The quantity of water flowing down the two becks below Skipton is very considerable?—Yes, at times.

14,699. Your population is only 5,000?—About that.

14,700. You have here a comparatively small amount of impurities in the river and a large quantity of water to dilute those impurities?—I think so.

14,701. You are therefore very favourably situated?—Yes.

14,702. But you would admit that it would not be fair to take your case as an example of the state of things which exists throughout the whole course of the rivers Aire and Calder?—I think not. As I was saying, when the water that comes down the stream in the summer months is reserved in the mill-dams the smell during the evening is bad, because there is a very small quantity of water to dilute the sewage and other impurities; otherwise there is no nuisance perceived at any time by the side of the brook.

14,703. You are aware that when that state of things is aggravated, I mean when the quantity of impurity is a larger proportion of the volume of water, a serious nuisance arises?—Yes; for instance, the beck at Bradford or the river near Leeds.

14,704. It is a question of principle. If in one case it was said that a nuisance was so small that it might be allowed to pass unnoticed what law could you introduce to meet other more serious cases?—I think that one general principle ought to apply to all cases.

14,705. You think at the same time that all proper indulgence should be given to this as to other towns which have difficulties to surmount?—Yes.

SKIPTON.

Mr. R. H. Sidgwick.

29 Nov. 1866.

14,706. But the evil is an evil be it ever so small?—Yes, it is the commencement of an evil which will naturally grow worse.

14,707. It might be said that the evil is at the beginning of the streams that feed a river, and that the evil grows worse and worse the lower you come down?—Yes.

14,708. Any reasonable measure, either for towns or manufactories, which should be devised you at Skipton would be just as ready and willing to comply with as other towns would be?—Yes, I think so.

14,709. (*Chairman.*) How is the town supplied with water?—By waterworks from a hill above the town. There are two reservoirs on that hill.

14,710. Do you manufacture only white calico?—Yes, except that we weave a little for Bradford occasionally.

14,711. You do not dye or print?—No.

The witness withdrew.

Mr. JOHN HEELIS (Skipton) examined.

Mr. J. Heelis.

14,712. (*Chairman.*) You are the son of the clerk to the board of health?—Yes.

14,713. Your father has been clerk I believe since the formation of the board?—Yes.

14,714. Did you hear the evidence that was given by Mr. Sidgwick, senior?—Yes; at least I heard the greatest portion of it.

14,715. He gave the population at 5,000, and the rateable value of the district as 7,000*l.* from houses and 3,000*l.* from land?—Yes.

14,716. He also gave information as to carrying out certain works. Was all that correct?—Yes, as far as I know it was perfectly correct.

14,717. Upon what other points besides those he touched upon can you give as any information?—I do not think I can give you any other information, but I will hand in a copy of our byelaws (*handing in the same*). We are under the Local Government Act.

14,718. Are many new houses being built?—There have been a good many new ones built, not large houses, but small houses for the manufacturing population.

14,719. What steps are taken by the board when new houses are being built?—Before any new buildings can be erected all plans are obliged to be submitted to the board of health, and to be approved by the board beforehand.

14,720. What arrangement does the board require to be made as to privy accommodation or waterclosets?—They require waterclosets to be made to the new houses, but existing privies are not directed to be altered unless they become a nuisance. When they are found to be a nuisance an order is made that they shall be turned into waterclosets.

14,721. Has that been carried out to any considerable extent?—Yes.

14,722. (*Professor Way.*) Have you power to suppress nuisances caused in the streams?—No.

14,723. Supposing that any factories were to be erected here which seriously affected the streams, should you have any power to prevent any nuisance that might be caused by them?—No, except by preventing the erection of the buildings altogether. We have that power because no building can be erected unless the plans are submitted to the board and approved. If the drainage was likely to pollute any stream and cause ill-health then the building would not be approved.

14,724. You think that you would have power under the provisions of the Act to prevent any building being erected that might cause a nuisance?—Yes.

The witness withdrew.

Mr. JOHN SCOTT (Skipton) examined.

Mr. J. Scott.

14,725. (*Chairman.*) Do you reside in Skipton?—Yes.

14,726. How long have you resided here?—22 years.

14,727. Have you carried on business in Skipton?—Yes, I am a brewer.

14,728. Have you carried on that business during the whole period of your residence?—Yes.

14,729. What water do you use for brewing?—We have waterworks of our own for brewing purposes, and we use the canal water and the brook water for rinsing and such things.

14,730. Do you use steam power?—Yes.

14,731. To what extent?—10-horse.

14,732. What do you do with the ashes?—We lead them away in all cases.

14,733. What volume of water do you use for brewing independently of cleansing and what you use for steam power?—I cannot tell you the number of gallons, but I can tell you the quantity of malt that we brew.

14,734. In cleansing your casks and other vessels what becomes of the refuse?—It is turned through our drains into the Ellar beck, which is a tributary to the river Aire at a distance, I think, of a mile or more from the river.

14,735. Is that refuse of an objectionable character?—No, I think not from the brewery. It is pretty sweet sort of stuff. I think there is no bad smell with it.

14,736. Do you send any spent materials from your brewery into the beck?—None at all. We collect all the rinsings from the mash-tubs and spent hops for manure. We collect them in our middens. The grains of course go into the country for stock.

14,737. What is the name of the beck that passes through Skipton?—It is called the Ellar beck.

14,738. And your works are situated upon it?—Yes.

14,739. From what source do you obtain your water for brewing?—We have a watercourse from a place called Skibeden Springs, and we collect the water into a tank that we have provided.

14,740. Is it soft water?—No, hard water.

14,741. Are the springs in the limestone?—Yes, and we collect two or three springs into one tank, and so bring the water down.

14,742. Is the water of the beck hard or soft?—The Ellar beck water varies very much, but it is soft water.

14,743. What is the character of the water that is supplied to the town?—I think it comes partly from limestone and partly from millstone grit.

14,744. How many hands do you employ?—11 or 12.

14,745. What do you do with their excrements?—We have one privy for the men, and the refuse goes into the horse and pig midden, it does not go down the beck, it is taken on to the land along with the manure.

14,746. The only pollution that you cause in the beck is from the washing out of the casks?—Yes, that is all; we lead all the solid refuse away in every case, and always have done so.

14,747. Would there be any great objection to your taking even the other refuse away and putting it on the land, or passing it into a sewer, and so that it might be conveyed to the land with the sewage of the town?—I think that the refuse from the brewery would not be worth anything as manure. We have a very large supply of water, and we use it all.

14,748. Is the water of the brook so polluted that you could not use it for brewing purposes?—No, it is clear water with us, or moderately so.

14,749. (*Professor Way.*) Is soft water suitable for brewing?—No.

14,750. Does it make the beer too dark?—No; but it gets too much out of the malt, it gets thick.

SKIPTON.

Mr. J. Scott.

29 Nov. 1866.

14,751. I suppose you cannot brew pale ale with soft water?—No, not to be very good.

14,752. Do you know how hard the water is that you use?—I do not know that exactly, but we sent it up to Leeds to be analysed, and the report that we received was that it was very similar to the Burton water.

14,753. (*Chairman.*) I believe you know something about the land below the town?—I only farm a very small quantity of it.

14,754. To what extent do you farm?—Only about 4 acres in the valley.

14,755. Do they lie on the border of the River Aire?—No, they are at a good distance from both the river and the beck.

14,756. Is that land subject to flooding?—It is never flooded.

14,757. Have you observed, that land which was formerly subject to flooding is now not so much so?—Yes.

14,758. Has that exemption from flooding been beneficial?—We consider so.

14,759. Has there been an improvement in the health of persons residing near to the land that was formerly more flooded?—I do not know that.

14,760. Was there much fever among the people formerly who lived upon the low grounds?—There is no population near the places which were flooded, no houses.

14,761. (*Professor Way.*) If the water does get to the land, I suppose you would endeavour to regulate it as to when it should come, and when not?—Yes.

14,762. Are any arrangements made, any embankment constructed, or any improvement of the river below for the purpose of irrigating the land?—I do not know.

The witness withdrew.

Mr. W. Graham.

Mr. William Graham (Keighley) examined.

14,763. (*Chairman.*) I believe you are a member of the local board of Keighley?—Yes. It was thought by our board that you had not received sufficient information as to the waterclosets at Keighley, and a deputation of gentlemen in the town called upon me, as I had been a member of the board, and expressed a wish that I should come to give you further information. I have now obtained that information, and with your permission I will give it. I may state that we have a strong impression that there is no use for waterclosets, that they are a great nuisance in every place, and very injurious to health. We think that they can be dispensed with altogether. I have brought with me a list of the persons who use waterclosets, and of those who do not. A great many of them use the sewage for the land and take it direct from the factories, they do not put it into the water at all, while others will do so, whether the board like it or not, we have endeavoured to stop them. We have never passed a plan, I believe, since the board commenced its operations, with waterclosets in it, and there is a very strong feeling against their use on the part of the Board of Health.

14,764. Nevertheless are there not a number of mills at Keighley which have waterclosets attached to them?—Yes, I believe there are some, but a number of them have not any, there are only a few that have waterclosets.

14,765. Is not the refuse collected at a number of them, and sent out into the country to be applied to the land?—Yes; they have tanks or barrels with wheels, and they wheel the refuse away, it is taken and laid up, and covered with soil, and then the compound is used direct for the land. I have a list here of the names of the persons by whom it is dealt with in both ways.

14,766. How many hands may those who use waterclosets employ, and how many hands do those who carry away the refuse in any other manner employ?—I cannot say exactly, but I believe there are as many who do not use waterclosets as do.

14,767. Do you think that the number of hands employed in each case is the same?—I think that those who do not use waterclosets probably employ the largest number of hands.

14,768. Your board seem to entertain the idea that the use of waterclosets is prejudicial to health?—Yes.

14,769. In what way would it be prejudicial to the health of people who are employed at mills?—In this way, the waterclosets are emptied into the beck, and there are dams down below, and those dams become stagnant for a time. Then there are waterwheels, and those waterwheels are constantly turning in this filth and dirt, only this last summer persons from some mills came to me, as being one of the Board of Health, and wished me to interfere to improve the condition of the water; and the overlooker said that the workmen in warm weather were going out of the mills sick, that filth would sometimes flow down so as to sicken any person. Again the sewage fills the lodges at the dams, and these sometimes are flushed out, perhaps once in a week, and then the stench is awful. We consider that this is a great cause of pollution.

14,770. Have you any evidence to prove that illness is caused by the sewage collected at these mills?—No. We have no evidence that I am aware of to show that there is any evil connected with the mills from collecting their own sewage in cases where it is taken away on to land.

14,771. I mean at those mills where the dams are?—I cannot speak upon that question, but people do complain very much of what I have described, and they consider it a source of discomfort. They say that sometimes they cannot stand it, and that they must leave the place altogether in the summer time.

14,772. That proves that it is necessary for your board to find some land to which to apply the sewage by irrigation?—We think that this can be done: that everyone can find for himself people who will be ready enough to take this material, if they can get it without ashes. On the other hand, we cannot find land in the neighbourhood. No one will sell his land there.

14,773. Some evidence was given at Keighley as to the number of waterclosets in the town; have you any further evidence to give?—I believe that upon the south beck there are 41 waterclosets connected with mills and two belonging to cottages, making in all 43. Then on the north beck there are in mills 10, and in cottage houses there are six, all emptying into the beck.

14,774. What number is there altogether?—I think about 59. Then again in private houses we have 44, which empty direct into drains, and which are supplied from our waterworks. There are a good number of houses in the town independently of these where they use cesspits. They do not, I believe, use our water.

14,775. How are the cesspools cleansed?—I do not know.

14,776. Is there any overflow from them into your sewers?—No; in that case there is not. We do not let the liquid come into the drains in that kind of way if we can help it.

14,777. Are ashpits numerous in Keighley?—Yes, I should say there is a great number.

14,778. Has your board taken steps to prevent their becoming a nuisance to the persons living near them?—Yes; we employ an inspector of nuisances, and when he sees anything of that kind, if the parties do not remove it, we cause it to be taken away, and charge the people with the cost. The inspector gives them notice that the nuisance is to be removed within 24 hours.

14,779. Have you found that the health of the inhabitants has been at all improved by doing this?—I do not know that we have; public health varies very much, and I cannot speak exactly on that question.

SKIPTON.

Mr. W. Graham.

29 Nov. 1866.

14,780. Within your knowledge have there been parts of the town where disease has been more prevalent than in other parts?—Yes.

14,781. Where are those districts situated?—Generally in the higher districts.

14,782. Is there any cause to which you can attribute that greater liability to sickness?—I have asked medical men often, and I never could ascertain what the reason was, there is generally most fever on the hills.

14,783. Are the sewers carried up to those high places?—No.

14,784. Are they properly ventilated?—In many cases there is a current of water that runs through them.

14,785. But are means provided to enable the gases to pass away?—No.

14,786. Are you aware that if a system of sewerage is carried out without proper ventilation, you are very apt to remove the cause of fever from the lower part of the town which was badly drained before, and where probably cesspools were numerous, to the upper parts of the town by the foul air rising up to them?—Yes; but the places I have alluded to pass the sewage direct into the beck, and by very short drains, one of them is not more than 100 or 200 yards right down, and the incline is very great. In another case the drains are perhaps not more than 200 or 300 yards long. I should mention that in the neighbourhood for 5 or 6 miles round Keighley, there is more fever on the hills than in the valley.

14,787. Are the houses where fever prevails inhabited by persons in the better condition of life?—We have had it both ways, we have had fever at different times in some of the very first-class houses in the neighbourhood, at the late Mr. Marriner's for instance.

14,788. In the cases that you have been acquainted with have you found cesspools in connection with waterclosets?—They do not use cesspools that I am aware of, they let the sewage go into the beck, if they use waterclosets at all.

14,789. In the houses situated as you have stated on the side of a hill is it customary to have ashpits below the floors of the houses?—I should say not, as a rule.

14,790. In passing last night from Keighley to Cullingworth we saw a number of ashpits placed under the sleeping rooms?—I am not aware that that is so as a general rule in the country.

14,791. But is it not the fact that there are such places?—Yes; there are such cases, but not many.

14,792. Do you not think that ashpits so situated below rooms in which people sleep are likely to give rise to fevers?—I cannot say; I cannot understand fevers in that part which you allude to, it is not subject to fevers. In the opposite direction there is a space of about a mile square, it is on the south-side of the town, and the registrar has informed me that he has had more cases of fever there than in any other place in our district. I have the facts to which I have spoken here in these papers (*handing in the same*), but I cannot give you any reason. The lower part of the town below the railway when we had fever so bad is all well drained now, and in those localities we have less fever than in any other part of the town.

14,793. Are you aware that some cellar dwellings in Keighley were flooded the other day, and that the people were obliged to turn out?—Yes.

14,794. And that the liquid which flowed into those cellars was very objectionable and smelt badly?—Yes.

14,795. I believe steps have been taken, by whitewashing, in some degree to mitigate the evil?—Yes; but the parties are doing it themselves, we do not do it.

14,796. Do you think that dwellings liable to be flooded as these were with this objectionable matter, can be fit habitations for human beings?—I mean to say that the people will take the best steps they can themselves to do what is necessary without any sanitary body interfering with them, in many cases of this kind the people have friends in the town, and until they get their houses into a purified state they will not attempt to live in them, not the better class.

14,797. Have not some already returned to these cellar dwellings?—I have not heard of that.

14,798. Do not you think that it is very likely fever will break out in consequence of these people returning to their cellar dwellings?—I cannot say.

14,799. Would it not be a proper thing for the board to take cognizance of this state of things, and inquire of the medical officer how far it will be safe for these people to return to their dwellings until they are properly dried?—There are not so many houses in this condition. The greatest amount of filth that we have is caused in this way, some manufacturers and builders of cottage houses are narrowing the beck continually, and this raises the level of the water. I know of some houses which have been flooded just now to a serious extent, and the people have been obliged to go out altogether, they were 3 or 4 feet deep in water, formerly it was not so. The beck has risen several feet since I first knew it, perhaps 3 or 4 or 5 feet in places; where the beck has been so narrowed, the water rises higher than it did formerly, when it was not so liable to flood cellars, and other property in low situations.

The witness withdrew.

Mr. John B. Dewhurst (Skipton) examined.

Mr. J.B. Dewhurst.

14,800. (*Chairman.*) Are you resident in Skipton?—Yes.

14,801. Do you carry on any manufactures here?—Yes; cotton spinning, and cotton and worsted manufacturing.

14,802. Where is your manufactory situated?—At the outskirts of the town, on the Ellar beck below the town.

14,803. How many hands do you employ?—About 640.

14,804. Is that as many as you have been in the habit of employing for years past?—Yes.

14,805. How long have you carried on business here?—For nearly 40 years.

14,806. You were affected, I suppose, like many other manufacturers by the war?—We did occasionally run short time.

14,807. Did you find that many of your workpeople left you?—No.

14,808. Do you carry on any dyeing?—Yes; we dye our own warps, such as are required to be dyed.

14,809. What becomes of the refuse from your dyeworks?—The liquid refuse goes down the beck.

14,810. What becomes of the solid refuse?—The bulk of it is carted away with the ashes from the fires.

14,811. Do you chip your dyewoods?—The logwood is generally rasped, but I believe it is chipped now.

14,812. The waste chips you say you collect and send out into the country?—Yes; at least it is thrown into a heap with the ashes.

14,813. Do you think you would find any difficulty in purifying the liquid before you send it into the beck?—I think we should; I do not see how it could be purified. If it is sent into a tank to deposit, it only deposits solid matter, so that what is injurious would go forward still.

14,814. Mr. Townend, who was examined at Keighley, stated that he passes all his dye water on to a heap of ashes from his mill, about 18 feet in depth; that the dye water percolated through those ashes, and passed away pure?—That I think we could easily do; any means that can be adopted we should be glad to adopt; it is a plan that we have thought of trying.

SKIPTON.

Mr. J. B. Dewhurst.

29 Nov. 1866.

14,815. If you found that such purification could be carried out without trouble or much expense, would you be willing to adopt it?—We should be willing to adopt any means.

14,816. Is any other refuse sent from your works besides what you have mentioned?—From two-thirds to three-fourths of our premises is accommodated by waterclosets, which are connected with the beck. As to the other part we have a tank, and the night soil is carried to the land.

14,817. Would it be very burdensome to you if you were obliged to collect it all and send it into the country to be used on the land?—It would be difficult to do so; but if we were obliged, we should of course do it.

14,818. How much coal do you use in a year?—About 3,000 tons.

14,819. What do you do with the ashes?—They are carted away for various purposes; none are passed into the beck, nor have been for the last 12 months, and it is not our intention to let any more pass in.

14,820. What horse power do you employ?—The nominal power is about 120 horse.

14,821. Do you use any water power?—Not here.

14,822. For dyeing purposes where do you get water?—From the beck.

14,823. Is it polluted before it comes to you?—No; we have no fault to find with it.

14,824. After you pass your refuse into the beck from the dye works, would the water be fit for another manufacturer situated below you to use?—Yes; because there is much more water in the beck than we require to use, even in the driest time.

14,825. Still the character of the refuse that you throw in is, as far as it goes, objectionable?—Yes; but it is so minute. I have just reckoned up the quantity of dye stuffs that we have used during the year, logwoods, and other dye woods, shumach, gambier, sulphate of copper, and sulphate of iron, it amounts altogether to about 60 tons.

14,826. (*Professor Way.*) How many dye vats have you in the mill?—They are all for dyeing warps; we have a set for dyeing black, and a set for dyeing colors. We do not employ more than about eight or nine men and lads in the business.

14,827. Then you do not discharge a very large quantity of spent dyewater into the beck?—No; the waste liquid from logwood is almost colourless when it leaves us.

14,828. And that is discharged into a large volume of liquid?—Yes.

14,829. The quantity being small would be easily dealt with?—Yes, all these things are diluted with water.

14,830. Do you dilute when you are running off the logwood vats?—Yes, the liquid runs through two or three logwood vats, becoming weaker and weaker, and it runs away from the last vat of a very different colour from that in the earlier vats.

14,831. Still the liquid is used over and over again in different vats, and then it is ultimately discharged?—Yes, it is discharged when it is so weak that we cannot use it any further.

14,832. Is not that liquid dark?—Yes; but you may say that in each vat it gets lighter; it is not darker than dark vinegar as it comes out of the last vat.

14,833. Is there not some solid deposit in it?—No, the chips have all come out in the preparing and boiling process.

14,834. You are speaking of the dye vats?—No; the preparing and boiling to extract the colour are done in a separate vessel where the solid matters are deposited.

14,835. Does not a mixture of sulphate of iron and bi-chromate of potash produce the colour?—Sulphate of iron and logwood are used in different compartments of the same machine or dye vat.

14,836. Is not the mixture of the two the cause of the black colour?—The liquid is black before the logwood is applied to it.

14,837. Is any of that black colour produced outside as well as inside the warps?—In the fibre.

14,838. It is all equally coloured through the warp?—Yes.

14,839. (*Chairman.*) In dyeing a certain quantity of dye is fixed in the warp, is there any dye upon the exterior surface of the warp that is liable to be washed away afterwards?—Yes, there is always a little.

14,840. (*Professor Way.*) That is the dark matter which causes the dark colour of the water of the Aire and Calder lower down?—Yes.

14,841. Apart from the question of purity, the colour of the water in the river undoubtedly is derived very largely from dye refuse, is it not?—Yes.

14,842. The question is whether that dye refuse is in solution or suspension?—I should have thought that it was in solution, subject to your correction.

14,843. If it could be kept out of the streams, I suppose the appearance of the streams in point of colour would be considerably improved?—Yes.

14,844. (*Chairman.*) What weight of cotton do you manufacture in the course of a week?—From about 8,000 lbs. to 9,000 lbs. weight of cotton at this mill.

14,845. (*Professor Way.*) Is that dyed with mordant?—Yes; shumach is, I presume, the mordant.

14,846. Do you use lime at all?—Yes.

14,847. Can you state the quantities that you use?—Yes; I have an account here (*handing in the same*). In the items of lime and chloride of lime; the larger item is lime, unslacked lime, the smaller quantity is chloride of lime.

14,848. For what purpose do you use lime?—It is used in the dyeing of black. I do not know what it does.

14,849. At what stage of black dyeing is lime put in?—It comes in after it has gone through the shumach. So far as the lime is concerned, the solid matter is put into cisterns and goes on to the land; only a portion of the lime water will go down the stream, and that is very fully exhausted; lime fixes the colours.

14,850. (*Chairman.*) Is your yarn sent chiefly into the worsted districts?—Yes, to Bradford, and it is exported for the same purposes.

14,851. Do you print at all?—No.

14,852. Do you produce any of the brighter colours, any of the aniline dyes?—Yes, but only a very small quantity; whatever dyes are required of us we produce.

14,853. Is the water you use suitable for aniline dyes?—Yes.

14,854. I suppose you can produce a better scarlet than they can at Leeds?—Yes; I should say so.

14,855. By using the water of the Aire?—Yes.

14,856. It is an advantage, is it not, for bright colours to have a fine soft water?—Yes.

14,857. But the colour is of greater importance than the hardness of the water?—Yes, I should say so, in delicate light colours.

14,858. Supposing you had to produce a scarlet, or mauve, or violet, with a water in which there were black particles suspended, could you do it?—I should think it would be impossible to produce passable colours.

14,859. How long have aniline dyes been employed here?—We have only dyed here in the last two or three years, and we have not used the aniline dyes for perhaps more than 12 months.

14,860. Do you use any cochineal?—I believe not any.

14,861. I suppose you would not be surprised to hear that for the brighter colours the trade has been removed towards the sources of the streams in order that dyers might get purer water?—No.

14,862. Nor that in Leeds, unless by using the water brought in by the companies, they can hardly produce the best colours?—No; I think it is very likely to be so.

14,863. Pure water is not so important in the case of blacks and blues?—No, nor in dark browns.

The witness withdrew.

Mr. William Bradley (Skipton) examined.

14,864. (*Chairman.*) I believe you are a surveyor to the local board of health here?—Yes.

14,865. How long have you held that appointment?—Since November 1858.

14,866. Has a system of sewerage been carried out whilst you have been surveyor?—Yes.

14,867. Who reported upon it?—Mr. Curlew.

14,868. Has it been carried out in accordance with that report?—Yes.

14,869. When was it completed?—I believe in 1860.

14,870. Are the houses in Skipton connected with the sewers?—Yes; a great part of them, I may say nearly the whole, are connected; but the drains are not all laid down. The stone drains are connected in many places with the main sewers.

14,871. Do you mean that there is not a direct connexion between the houses and the new sewers?—There is in the case about 100 houses.

14,872. In other cases are the old drains connected with the sewers?—Yes.

14,873. What number of waterclosets are there in Skipton?—About 100.

14,874. How many ashpits and privies are there?—I should say about 200.

14,875. Does your board encourage the conversion of privies into waterclosets?—They have done so.

14,876. Where privies have been so converted, has there been any improvement in the health of the people?—There has.

14,877. What direct information can you give us upon that point?—I have had it from the parties themselves who use waterclosets, that they have been a great benefit to them; the benefit has been evident, we have had many privies turned into waterclosets, and by doing away with the nuisance, health and comfort have been improved.

14,878. You believe that the general health of the people residing in these houses has been improved?—I do not say anything about health, but comfort.

14,879. In these cases were the ashpits and privies immediately adjoining the house?—Yes, in many cases they were reported to the board as a nuisance by the inspector.

14,880. Were they sometimes within the house itself?—No, I do not recollect any one being in the house.

14,881. When new buildings are erected, do you take steps to have privies or waterclosets built according to some rule?—We require waterclosets to be built except in cases where there has been no main sewer, and then we have been obliged to allow privies to be made.

14,882. Can you state what the death rate in the parish of Skipton is?—No; Mr. Bailey will give that evidence.

14,883. What are your general duties as surveyor to the local board of health?—I have the management of the highways, and I am collector of the rates. I have also to look after all buildings; the plans come to me and I keep them, and see that they are carried out. I have the management of all the sewers; and the main sewers are flushed out once in every week; we have flushing wells at the heads. We get the water for flushing some of the sewers from the water company, and for flushing other sewers from the milldams; it is turned into the sewers from a well which holds 600 gallons, and we send it all down at once.

14,884. Is there much foul gas in the sewer?—There was foul gas at the two ends of the sewer, and I hung a door with hinges which could be raised up and down by the water, for the wind, when it was in the west, blew up the sewer, and the air of the sewer smelt very badly at other times. The engineer had left all the gullyholes trapped, and when the sediment was taken out, the water necessarily was lowered in the gully, and then came up the foul air. I have taken many of those out, and caused a direct communication from the gully into the sewer.

14,885. Have you found a decided benefit from opening the ends?—Yes.

14,886. Are the sewers ventilated?—There is no other ventilation except by spouts that go up the houses, and wherever there is a drain near to a fall pipe we ventilate the sewer into that.

14,887. How do the sewers work when there is a heavy fall of rain, do they work properly?—Yes, they do.

14,888. No foul smells are driven up into the houses?—No; we have very few complaints about foul smells.

14,889. I take it that your thorough system of flushing tends to prevent any sediment, and diminishes the accumulation of foul air considerably?—Yes, it does.

14,890. Where is the sewage outlet?—Just below the town, at the junction with the Ellar beck and the other beck.

14,891. Have you considered the question as to the suitability of the land adjoining the outlet for irrigation purposes?—Yes, I have looked at it.

14,892. Have you taken any levels?—No; but they have been taken.

14,893. Was it found that the sewage could be applied to the land by gravitation?—Yes.

14,894. Do you find much sediment in any part of the river below the outlet of the sewer?—No; I have not seen much; what there was was all flushed away by the great flood.

14,895. If it was washed away by the recent flood it may be presumed to have been there before the flood came?—Yes, but I did not see it.

14,896. Have no complaints been made of its accumulating on the banks of the beck so as to become a nuisance?—No, not in our district.

14,897. Has your attention been called to the flooding of lands adjoining this beck and on the river Aire?—Yes.

14,898. Have you watched the improvements that have been made by the Airedale Improvement Company?—Yes, I have, lower down the river.

14,899. Do you find that, with the same fall of rain in the neighbourhood, the land is more or less flooded than it used to be?—I do not think that it is more flooded; I think that the water gets off more quickly.

14,900. Has that been an improvement to the adjoining land?—Yes, a great improvement.

14,901. How many years is it since these works were carried out here?—About two years ago.

14,902. You would hardly yet have seen much benefit from them?—There has been very great benefit up to the present time.

14,903. Would the lands have suffered much more by the late flood, if those works had not been carried out?—I have no doubt that they would.

14,904. Have you seen any of the means that have been resorted to for dealing with the debris that comes down the different becks?—No.

14,905. Have artificial banks been very generally raised down the valley between this town and Keighley, or are they of recent construction?—No, they are old embankments.

14,906. Can you say whether, within your recollection, the bed of the Aire has risen within those embankments?—No, I cannot speak to that.

14,907. How are the ashes and the contents of privies taken away from the town of Skipton?—They are taken away by a scavenger appointed by the board to the north and south of the town to places taken for the deposit of this refuse.

14,908. Is that carried out as a system throughout the town?—Yes.

14,909. At whose expense is it carried out?—At the expense of the parties.

14,910. Do you find that they are willing to bear that expense?—They are not very willing, the parties would rather take it away in the daytime, but the board will not allow that to be done.

14,911. Do you take precautions to disinfect these places after the scavenging has been done?—No.

SKIPTON.

Mr. W. Bradley.

29 Nov. 1866.

14,912. Do you use no chloride of lime?—Not that I know of.

14,913. What is the cost of conveying this refuse from Skipton in the course of a year?—I should say that if it was contracted for it would cost more than 150*l.* a year.

14,914. Does it cost more than that now?—The board pays for all the road scrapings and the leading away of the sewage and the cleaning out. The occupiers pay for cleaning out the ashpits themselves.

14,915. Do you take all the refuse from the roads into the country?—Yes, and put it on to the land, all of it.

14,916. (*Professor Way.*) In laying out your drainage system you must have known, I suppose, what quantity of water was likely to come through the sewers?—Yes.

14,917. Do you know any reason why the quantity of water should be so large as it has been described to us to be?—No.

14,918. Do you know the nature of the land below Skipton?—Part is clay land and part gravel.

14,919. There is a large extent of tolerably flat surface, is there not?—Yes.

14,920. Is there any large quantity of land in the hands of one landower?—Yes, there is in the hands of Sir Richard Tufton.

14,921. The estates below Skipton are largely possessed by him?—Yes.

14,922. Is he resident here?—No, but he has an agent here.

The witness withdrew.

Mr. J. Calvert.

Mr. JOHN CALVERT (Skipton) examined.

14,923. (*Chairman.*) I believe you are manager of the Skipton waterworks?—Yes.

14,924. In what year were they constructed?—In the year 1823.

14,925. Were you connected with their construction at all?—No, I was not.

14,926. By whom were they constructed?—By a private company.

14,927. Where are the waterworks situated?—In the valley below Rumble's Moor.

14,928. What distance are they from the town of Skipton?—About half a mile.

14,929. What is the extent of the gathering ground from which you draw your supply of water?—From 1,000 to 1,200 acres.

14,930. What is the area of your reservoir, or have you more than one?—We have three reservoirs.

14,931. What are their areas?—The three would hold about 7,000,000 gallons of water.

14,932. Of what height are the embankments?—Of one 9 feet, of another 17 feet, and of the third about 11 or 12 feet.

14,933. Have you provided means for passing off flood water at the side of those reservoirs?—Yes.

14,934. Had you any difficulty the other day during the heavy rains in passing off the overflow?—We had a little difficulty.

14,935. What steps were you then obliged to take?—The water came out on to the embankment and we planked it across and threw it down the bywash and it had a more rapid fall.

14,936. You put the planks on the top of the embankment?—Yes.

14,937. What is the level of the bywash?—The bottom of the bywash would be about four feet below the surface of the reservoirs.

14,938. What depth of water was then passing over the bywash?—It was full.

14,939. To which of the reservoirs do you now refer?—I should explain that one bywash answers for the whole of them, they are in a series on the same stream.

14,940. What is the length of your bywash?—About 250 yards.

14,941. What is the width of it?—About 4 feet 6 inches.

14,942. During the late heavy rain the water was passing over a width of 4 feet 6, and a depth of 4 feet?—Yes.

14,943. And the reservoir was level with the top of your embankment?—The reservoir overflowed the embankment.

14,944. Is it your intention to let the reservoirs remain as they are?—This was the first and only time that we have ever seen them overflow the embankment.

14,945. Shall you recommend steps to be taken to extend that bywash so as to prevent a repetition of that which might have been the cause of considerable mischief?—I have no doubt that the waterworks company would take some steps if they could see a necessity for it; they never object to do anything of that kind.

14,946. Do not you see a necessity for it?—Yes, I do, and I shall bring the matter before them when they are called together.

14,947. And urge it rather strongly, as you think it ought to be done?—Yes, it is very necessary.

14,948. (*Professor Way.*) Were you in any fear of the embankment at the time?—Not at all.

14,949. Does the washing of the water over the embankment tend to interfere with it?—The manner in which we succeeded in getting quit of the water entirely removed any apprehension. We got some planks and laid them on edge the length of the embankment, and that threw the water down into the channel of the bywash which was at a considerably lower incline than the part level with the reservoir; we did not feel disposed to cut the embankment.

14,950. Did you pass any water through the pipes from your reservoir?—I opened all the sluices and all the pipes that I could during the time when the water was so excessively violent.

14,951. In consequence of that there would have been flowing down the beck below, not only the flood water, but as much as you could pass out of your reservoirs?—Certainly.

14,952. There would have been more passing down the beck than would have been consequent upon that heavy fall of rain?—There would have been the quantity conveyed through a 6-inch pipe in addition to the overflow of water from the flood.

14,953. If the flood itself would have done damage, you by the necessity you were put to of opening the sluices, increased the volume and might so far have increased the damage done to property below the reservoir?—The quantity contained in the 6-inch pipe (which is the main pipe which supplies the town) would certainly have enlarged the flood, but not much. I thought it desirable to take all the means we possibly could to ease off the water from the reservoir.

14,954. You tried to lower the level of your reservoirs by opening all your sluices and letting the water run off, thereby adding to the volume which came down the beck?—Yes.

14,955. The water that you did let down so long as the reservoir was full would have come over the banks?—Yes.

14,956. So long as you did not lower the head you did not increase the quantity?—No.

14,957. (*Chairman.*) Was the result of this operation actually to lower the water in your reservoir?—I should state that the filter bed is below the reservoir, and I found that the water was accumulating so as to

be likely to pass over into the filter bed. Then I came to the town and opened the sluices, because from the filter bed the town is supplied, and whilst I was doing that I had a few men employed in putting planks across the embankment of the reservoir to throw the water down the by-wash.

14,958. What was the cost of your works?—About 7,000*l.*

14,959. What volume of water do you daily supply to the town?—About 100,000 gallons a day.

14,960. That is about 20 gallons per head of the population?—About that.

14,961. Is much of that 100,000 gallons used for manufacturing purposes?—None that I know of.

14,962. Is there a constant supply to the town?—Yes, except in very droughty times.

14,963. Do you find that with a constant supply the quantity consumed is about 20 gallons per head?—Yes, as near as may be.

14,964. Is yours a constant system?—Yes.

14,965. From what stratification do you obtain the water?—We get a portion of it from the Skibeden Valley, and the other we collect from Rumble's Moor Hills. The water comes down in a small stream from the mountains direct to the reservoirs.

14,966. Does the water come from millstone grit or limestone?—From millstone grit.

14,967. What is the quality of that water?—I cannot say, but it has been analysed.

14,968. Is it very soft water?—It is not excessively soft.

14,969. How many houses do you supply with water?—About 1,000.

14,970. How many houses are there in the town which are not supplied from your works?—I think there are not many.

14,971. 100,000 gallons distributed amongst 1,000 houses at the rate of 20 gallons per head would imply five persons to each house?—Yes.

14,972. At what rate do you supply the water?—It varies according to the rental of the houses from 5*l.* to 5*s.* a year.

14,973. Can you give in a list of the rates which you charge for the water?—No, I cannot at this moment.

14,974. You have no pumping?—No.

14,975. The water comes down by gravitation?—Yes, all by gravitation.

14,976. Then you pass it into each house?—Not into all. Some of them are supplied by stand-pipes, each of which supplies a certain number of houses.

14,977. Where are the stand-pipes placed, in the streets?—In the different localities, in courts and convenient places.

14,978. Do you supply water for cleaning the sewers?—Yes, we do.

14,979. Do you charge the board of health for that supply?—Yes.

14,980. At so much per annum?—Yes, at so much per annum for flushing each well.

14,981. Do you supply the railway company with water?—No.

14,982. What do you charge for each well to the board?—We charge 6*s.* 8*d.* for each well per half year.

14,983. What do you charge for supplying waterclosets with water?—The waterclosets vary. A cottage at a 5*l.* rental is charged 5*s.* a year for water rate, and if there is a closet attached to it we charge 2*s.* 4*d.* more, making together 7*s.* 4*d.* If we supply water to a 9*l.* or 10*l.* house the charge is about 8*s.* or 9*s.*, as the case may be, but it varies. Sometimes it is 1*s.* 6*d.* per quarter, this 6*s.* a year with a watercloset added.

14,984. For a 15*l.* house how much do you charge?—About 15*s.* a year for the water, and for the watercloset about 7*s.* 6*d.* a year. In a 20*l.* house we should charge 10*s.* a year for the closet and 1*l.* a year for the water for domestic purposes.

14,985. Above that rental what charge do you make?—We have not many houses above that rental.

14,986. Have you water rates for baths?—Yes, we charge 5*s.* a year for each bath.

14,987. Are there any public baths?—No.

14,988. Do the improvement commissioners take water from you for watering the streets?—No.

14,989. (*Professor Way.*) You say that you supply 100,000 gallons per day?—Yes.

14,990. That is for domestic use, and you supply a further quantity for flushing the sewers?—Yes.

14,991. Can you give us any notion how much that is?—No, I could not at the moment.

14,992. Do you think it is 20,000 gallons a year?—I should think it would not be far off that volume.

14,993. It would not double the quantity of water that you supply for other purposes?—No.

14,994. Do you think it is 50,000 gallons?—No.

14,995. You probably heard Mr. Sidgwick speak of the difficulty there would be in applying the sewage on account of the large bulk of water with which it was diluted?—I did not hear his evidence.

14,996. Do you know what the general supply to other towns is, or is it usual to supply 20 gallons of water per head?—I have heard of some towns being supplied with less and some with more. Some towns, I presume, are supplied with as much as 30 gallons per head.

14,997. Have you heard what quantity of water is supplied to Croydon?—Yes.

14,998. Do you know that Croydon is supplied with 1,000,000 gallons for a population something above 30,000, which would be over 30 gallons per head?—I daresay it is so.

14,999. I suppose that in very many districts where there is a porous soil the quantity of water which gets into the sewers from rain and from the surface is very much greater than the water supplied?—I daresay it is.

15,000. Would you be surprised to hear that at Croydon the quantity of water which actually passes out of the main sewer is from two and a half to three times as much as the water which is supplied to the town?—No.

15,001. If the whole of that could be applied to the land with benefit, do you see any reason why you should not apply the whole of your 20 or 25 gallons per head?—Certainly not.

15,002. The volume with which you would have to deal is not after all an excessive quantity?—No, it is not, but we could not exactly maintain that quantity in a very droughty summer, such as we have had the two last summers.

15,003. I suppose you would have plenty of water to dilute the sewage with if you wanted to do so at any time?—No.

15,004. When your watercloset system is fully carried out I suppose you could do with the same quantity of water as other people do under like circumstances, that is to say, for the supply of 5,000 people, you must make 20 gallons per head suffice?—Yes, if that would be sufficient. My opinion is that if the watercloset system was carried out the amount of water that could be collected from the sources that we have, if properly stored, would give more than 30 gallons per head.

15,005. You might get more if you wanted it, but you are not obliged to pass through your sewers more than is necessary, and you are not likely, I suppose, to be obliged to do so?—No.

15,006. Have you paid attention to the question of applying sewage to the land?—No, I have not, except that I have read a little about it.

15,007. (*Chairman.*) Are there any mills situated on the beck below your reservoirs?—None.

15,008. You have no compensation to give?—No.

The witness withdrew.

SKIPTON.

Mr. W. Marsden.

9 Nov. 1866.

Mr. William Marsden (Skipton) examined.

15,009. (*Chairman.*) I believe you are a surgeon in this district?—I am.

15,010. And a member of the College of Surgeons?—Yes.

15,011. Have you practised for many years in the neighbourhood of Skipton?—About 48 years.

15,012. Then you are well acquainted with the state of health of the people in the neighbourhood?—I am.

15,013. Has it improved since you first knew the neighbourhood of Skipton?—Very much.

15,014. Has the population of Skipton itself increased within your recollection to any great extent?—It has.

15,015. What was it when you first knew it?—I cannot tell exactly.

15,016. Do you suppose that it has doubled within the 48 years?—No, I should think that it is about one-third more.

15,017. To what do you attribute the improvement in the health of the people of Skipton and the neighbourhood?—To the general cleanliness which has been maintained, not only by the medical men, but by the town itself; the town is very much cleaner than it used to be.

15,018. From what period has that improvement been marked?—I should say that it has been observable in the last 24 or 25 years. It has arisen from the establishment of the gas company, and also from paving and keeping the streets cleaner than they used to be.

15,019. Then the improvement was in operation before the formation of the local board of health?—Yes, the local board of health is quite young.

15,920. Who were the movers in the improvement previous to the formation of the local board, that is to say, the improvement in the condition of the town which led to the improvement in the health of the people?—I should say the inhabitants generally. There was a general stir not only by the medical men but by the officers of the town.

15,021. What is the character of the diseases which you find to be less frequent now than they were 35 years ago?—Fever in general; common fever, typhus fever.

15,022. Has the improvement been more marked since the local board have taken steps to improve the condition of the cottages?—That is only of very recent date, it has only just come into force.

15,023. Can you feel it?—I am sure that there has been less disease in the town of late years; less fever disease.

15,024. As well as fewer deaths?—I know that the deaths have increased on account of the number of inhabitants.

15,025. But I mean fewer deaths in proportion?—About 25 years ago there was a season when double the number of interments took place in one year than had ever been known before.

15,026. But there is a marked improvement in the general health of the people?—Yes.

15,027. And that is a very important element?—Yes; the cause is that we have had a more plentiful and better supply of water, and the streets have been kept cleaner, and the roads have been kept cleaner and in better condition.

15,028. And the people are more comfortable?—I should say so.

15,029. In your experience have you found that this improved condition of the people has led to the diminution of drunkenness among the people?—I cannot say that. Skipton is not to be called a drunken town, but we have about 35 or 36 inns in the town, and they must be made use of by some people.

15,030. Is that supply consequent upon the demand within the town?—No, it is on account of the fairs in the locality.

15,031. Are there many fairs held in the town of Skipton?—Yes, when cattle fairs are permissible; at present they are shut up.

15,032. Is Skipton the centre of a considerable agricultural district?—There is an immense district round about.

15,033. And the cattle are brought here for sale?—Yes, from 20 miles round.

15,034. How many fairs are there in the course of the year?—There are fortnightly fairs besides annual fairs.

15,035. Do you think that the fact of those fairs being so frequent, and of the number of publichouses which there are in the town to meet the requirements of the people coming to the town, has been injurious to the moral condition of the people?—No, the injury is only for one day.

15,036. Do you think that it does not leave its mark after that day has passed?—I think not. Of course that day is a day when everybody must have refreshment in one shape or another.

15,037. Do you know the district below Skipton through which the river Aire passes?—Yes.

15,038. We had it stated to us just now, that in consequence of the works which have been carried out, floods are less frequent now than they were formerly?—They are much less frequent.

15,039. It was stated yesterday, at Keighley, that in the neighbourhood of Skipton, when these floods were so frequent and excessive, fever used to be also very frequent; was that your experience?—Yes.

15,040. Have you observed any diminution in that fever?—I have.

15,041. There is less fever now?—Yes.

15,042. Do you attribute that to the carrying out of these works?—Yes; and the improvement of the health of the people by the drainage of all the villages and towns about.

15,043. How long have these works for the improvement of the river been executed?—Five or six years, not more than that.

15,044. But within that period the improvement in the health of the people has been so marked that you can state it as a fact?—I can.

15,045. Have you ague in the valley?—I may almost say never; I have not seen more than two or three cases of ague in the whole course of my practice.

15,046. Had you formerly much fever in Skipton itself?—Yes, and in Carlton, which is on the borders of the river. We are a mile from the river, and there is a good fall to the river.

15,047. What was the character of that fever?—Typhoid.

15,048. Is it as frequent now as it used to be?—No; it is now very infrequent, whereas formerly there were 70 or 80 cases in one winter. This was the largest number I ever had. It was in 1835.

15,049. Have improvements been made in the village of Carlton as well as in Skipton?—Yes, great improvements.

15,050. And do you attribute to those improvements the absence of fever?—I should say so, or rather to general improvement of the village itself.

15,051. (*Professor Way.*) Has there been much land drainage in this neighbourhood?—There has always been drainage going on.

15,052. Does the draining of a district improve its health?—Of course it does.

15,053. (*Chairman.*) On what beck is the village of Carlton situated?—It is south-west of the river.

15,054. Is it situated on a beck?—There is a small beck which comes down, but of no great moment.

15,055. Are there lead mines situated on that beck?—No, there are lead mines below, but not there.

15,056. What is the name of the beck on which the lead mines are situated?—It has not any particular name; the lead mines are three miles from Skipton.

15,057. Are those lead mines the property of the Duke of Devonshire?—They are; they are situated down on the south road to Keighley.

15,058. Do you know anything of that district?—Yes, I know it very well.

SKIPTON.

Mr. W. Marsden.

29 Nov. 1866.

15,059. Is there any refuse sent from those lead mines which is at all injurious to the water?—Not that I know of. The village is now supplied with good water.

15,060. Is the water used by the people residing on the banks?—Yes, they used to use that lead water.

15,061. You would not recommend that lead water for domestic use?—Certainly not.

15,062. (*Professor Way.*) The river after receiving the water from the lead mines does not come to you, does it?—No the lead mines are three miles south.

15,063. (*Chairman.*) In your experience, do you attribute any of the sickness to the presence of ashpits close to the houses?—All ashpits are nuisances, and are likely to create disease, but we have not many ashpits here.

15,064. Are you an advocate for their being converted into waterclosets?—I never thought much upon the subject. I know that the privies used to be very bad on account of the great number of people who had to go to them. We have not had time to give an opinion upon the waterclosets; they have only come into use in the last two years.

The witness withdrew.

Mr. Benson Bailey (Skipton) examined. *Mr. B. Bailey.*

15,065. (*Chairman.*) How many years have you resided at Skipton?—40.

15,066. Are you the Registrar of Births and Deaths for the neighbourhood?—Yes.

15,067. What is the extent of the district for which you keep the register? How many townships does it include?—Eight.

15,068. Can you give us the death rate in those several townships at present?—It is about 26 per 1,000.

15,069. Will you give it to us in each separate township if you can do so?—I cannot do that; I have made my calculation upon the township of Skipton, and not for each township, but I believe that the average will be almost the same, viz., 26 throughout the district.

15,070. Can you give us the population of each township?—I cannot at present.

15,071. Are the townships, other than Skipton, more of the character of villages and detached houses?—Yes.

15,072. Do you think that the death rate is as high there as it is in the town of Skipton?—Perhaps not quite, but there will not be very much difference.

15,073. Is it as high as 26 in 1,000 out in the country?—I think so, as nearly as I can calculate it.

15,074. Can you tell us what it has been for some years past?—There has not been very much variation, except in cases where there has been an epidemic.

15,075. Can you give it to us for a few years?—I daresay that I could with a little calculation; I have observed the matter for several years, and I have made the result about that. I believe that 26 per 1,000 annually is nearly correct as the number of deaths.

15,076. Did you hear the evidence of the last witness, Mr. Marsden?—I was present.

15,077. Did you hear him state that his experience was that the health of the people in this neighbourhood was very much improved of late years?—I think that I did hear him say so.

15,078. Is not that rather inconsistent with the return which you give us of the death rate?—The death rate seems rather high.

15,079. And from your account it seems to have been high for years past?—Yes.

15,080. Will you be kind enough to give us the death rate and the population of your district for as many years back as you can; that is to say, between 1851 and 1861, and up to the present time?—I will do so.

15,081. (*Professor Way.*) In the outlying districts is there much consumption?—The most prevalent diseases are bronchitis and phthisis or consumption.

15,082. And that, I suppose, has increased of late in the outlying districts, the exposed districts on the hill sides for instance?—From those districts there is very generally bronchitis.

15,083. And I suppose that an unusual death rate in an agricultural area may be occasioned by the fact of its comprising exposed and elevated districts where consumption occurs to a great extent?—I do not know that consumption prevails more in elevated districts, than it does in other places. I think that it is about as prevalent in the town as in the country, and in the country as in the town.

15,084. The question is whether your district is more liable to consumption than a more southerly district, that you do not know?—That I do not know of course.

15,085. (*Chairman.*) How many years have you been registrar?—About 21.

15,086. Is the district of which you keep the register the same now as it was 20 years ago?—Yes.

15,087. Can you give us the number of inhabitants within that district, and the deaths per annum then, and the number of inhabitants and the deaths per annum now?—I cannot do so at present.

15,088. Could you make out that return without much difficulty?—I could make it out from 1851 to 1861.

15,089. And on to the present time. If you will be kind enough to do so we shall be obliged to you?—I will do so.

The witness withdrew.

(*Mr. Dewhurst.*) There is a workhouse in Skipton with 100 inmates, which is the workhouse for nearly fifty townships, and which contains a number of aged people, the whole of the mortality of that workhouse comes into this township returns, and that increases our death rate.

(*Professor Way.*) That is an important mortality?

(*Mr. Dewhurst.*) Yes.

Mr. Leonard Horner (Skipton) examined. *Mr. L. Horner.*

15,090. (*Chairman.*) Do you live at Skipton?—Yes.

15,091. Are you engaged in any manufacture?—In the lead manufacture, sheet lead and pipes.

15,092. From pigs of lead?—Yes.

15,093. You obtain pigs of lead from the manufacturers and convert them into pipes and sheets?—We manufacture pigs of lead into sheets and pipes.

15,094. Is there any refuse from your works?—There are ashes.

15,095. What do you do with them?—We have them carried away by the boat on the Leeds and Liverpool canal.

15,096. You do not turn any of your ashes into the river?—No.

15,097. How many hands do you employ?—Ten.

15,098. Have you steam-power?—Yes.

15,099. Of about what amount?—16 horse.

15,100. What becomes of the excrement from the men about your premises?—That is taken away about every three months and is put on to the land.

15,101. None of it goes into the river?—None of it, we are not situated on the river, we are situated on the Leeds and Liverpool canal.

15,102. What quantity of lead do you manufacture in the course of the year?—On an average about 2,500 tons.

15,103. Where do you obtain it?—From the Duke of Devonshire's mines at Grassington and Conouley,

SKIPTON.

Mr. L. Horner.

29 Nov. 1866.

and a great quantity out of the north, from Richmond and from Llanelly in South Wales.

15,104. Do you know what weight of lead is obtained from the Grassington Valley?—At present the mines are very poor, in the neighbouring mines about 400 tons a year are produced, and at Cononley 200.

15,105. Do they wash the ore there?—Yes.

15,106. Do you visit the works?—No, I have not been there since I was a child. I cannot give you much information with respect to the washings at Grassington.

15,107. Do you know lead mines generally; have you visited them in other parts?—No.

15,108. (*Professor Way.*) You do not smelt at all?—No, we are not smelters, but merely manufacturers.

15,109. Have you to melt the lead?—The lead is melted.

15,110. You have I suppose to cast it in certain plates before rolling it?—Yes.

15,111. Is much dross produced?—About 4 tons of lead ore will produce about ½ cwt. of lead, and we smelt the ashes about every nine months.

15,112. So as to get out of them any lead which has escaped?—Yes.

15,113. Do you smelt the dross at the same time?—We preserve it until we get a sufficient quantity and then the smelter comes over and smelts the ashes for us.

15,114. What I call the dross is what you call the ashes?—Yes.

15,115. Is the silver taken out of your lead?—No; the duke's lead I suppose will not pay for extracting the silver, it is too poor.

15,116. They do not attempt to extract the silver at the works do they?—No, the lead is too poor, the process would not pay.

15,117. Is the health of your men good?—It is generally good, we have men that have been from 20 to 30 years on the premises.

15,118. You do not, I suppose, use water in any part of your operation?—No.

15,119. Are the men never affected through the skin by working the lead, have they not gripings, or lead cholic?—No, I have not known a case of the kind. We have ventilators over each pan, to carry off the fumes.

The witness withdrew.

The witness subsequently added to his evidence the following note: The watercourses should be provided with filters to keep out the quantity of gravel arising from the washings; and should be kept clear of dead dogs, etc., which being left in, in a dry season are an intolerable nuisance.

Mr. B. H. Bradley.

Mr. Benjamin Hutton Bradley (Skipton) examined.

15,120. (*Chairman.*) How far do you live from Skipton?—About a mile to the south.

15,121. You are vice-chairman of the Skipton Board of Guardians?—I am.

15,122. How many parishes are there in your union?—About 51.

15,123. What is the area?—About 150,000 acres.

15,124. What is the population?—About 37,000. I did not come here prepared to give any evidence, I was merely present as a listener.

15,125. As vice-chairman of the Board of Guardians have you observed the working of the Nuisances Removal Act?—We have had very little to do with it.

15,126. Have you not had to to with it for some years?—Some years ago when it became the law the guardians were concerned with it.

15,127. Did you then take any steps to remove nuisances in the union?—I was not in connexion with the board at that time.

15,128. The matter of nuisances is not now so immediately placed under the control of the board of guardians?—It is not.

15,129. How many years have you been a guardian?—I have been vice-chairman for six years. I was a guardian two years previously, making about eight years altogether.

15,130. Skipton is within the Skipton Union?—Yes.

15,131. Do you find that the health of the poor in Skipton has at all improved during your guardianship?—It has decidedly improved, the people are better kept, and better attended to than they were. There is in fact no destitution in the neighbourhood; they are all well employed, and are as comfortable as you would expect them to be in their position.

15,132. Considering the population of your union, 100 strikes me as being a small number to have in the workhouse?—It is a very small number.

15,133. Are they chiefly infirm persons or children?—We have scarcely an ablebodied person at present in the workhouse.

15,134. I believe that as well as being vice-chairman to the Board of Guardians you are one of the Airedale Improvement Commissioners?—I am.

15,135. Have you been so since the commencement?—Yes.

15,136. How many years ago was that?—The Act was got in 1861, but not much work was done till 1862.

15,137. Have the works in this neighbourhood been carried out for some years?—Yes, they have been completed in this neighbourhood for about three years.

15,138. Have you derived the beneficial effects which you expected from the execution of those works?—The health of the district is very much improved by them, and the land is improved to a considerable extent.

15,139. What evidence have you with respect to the improvement in the health of the people?—The villages were subject to fever from time to time, and it lingered about them for a long time, and there was a great loss of life. Within the last three years I do not know a case of any village suffering very much from fever. We had one case of typhus fever in our village at Bradley but it died away, and did not spread at all in the village. Previously, when a case of typhus fever broke out, it went through the village and would linger a long time about it.

15,140. As a member of the Board of Guardians of the poor you would have experience upon that point?—It is in that position that I see more of it than I otherwise should do. It is rather unfortunate that you have not the registrar from the Crosshills district here, they suffered very much from fever there. I think that he would have been able to show that the health of the district has very much improved since the drainage has been carried out.

15,141. It is highly desirable that we should have that information if you can get it for us?—I will speak to the registrar upon the point.

15,142. (*Professor Way.*) Has there been lately any diminution in the poor rate?—There has been a re-assessment, and since the alteration of the law many townships which before paid scarcely any poor rate now pay the full rate, and of course other townships are relieved to the same extent.

15,143. But have you any means of knowing the rate in the pound?—The total will be abont one-third less.

15,144. Then taking the whole district the rate has positively diminished?—Yes, the rate for the whole union will be about one-third less than it was, but what the result is to any particular township must depend much upon the effect of the alteration in the law.

15,145. But your experience would point out to you that a diminution in the causes of disease, and therefore in disease, and in the attendant deaths as well as discomforts, would alter the amount of the poor rate?—Yes; disease has a serious effect upon rates. We have frequently had families who have

been costing us 14*s.* or 15*s.* a week, of course that is for out-door relief, they could not be brought into the house in case of fever.

15,146. Therefore the reduction of the poor rate and the reduction of the death rate ought to have some relation to each other?—They should.

15,147. (*Chairman.*) You heard the registrar mention that in the district for which he acts the death rate is about 26 per 1000?—Yes.

15,148. That as you probably know is a high death rate for a country district as this is to a great extent, how can you account for it?—I do not know that that is the case, I am not prepared to say whether the rate is 26 in 1,000 or not.

15,149. (*Professor Way.*) Are not the forms returned to the registrar general?—They are, perhaps you would like to see the returns for the union. The registrar for Skipton, whom you examined, would have no knowledge of the whole union.

15,150. Do you think that the death rate for Skipton is 26 in 1,000?

(*Mr. Dewhurst.*) A few years ago it was above 30 in my recollection within the district of the Skipton Local Board of Health.

(*Mr. Bradley.*) I suppose that in the workhouse in Skipton the deaths will average fully one in a fortnight, and those are frequently cases which are brought in from a distance. Very often aged people are removed.

15,151. That would especially affect the death rate in Skipton?—It does so. It has been the custom for years past for families to leave this union to work in Bradford and Bingley and the districts below, and very often when they become infirm they are removable to our workhouse, and in that case of course we have a very old population thrown into our workhouse.

15,152. Is it not the case that one death in a fortnight, that is to say 26 deaths in a year, occurring in the union workhouse would account for five or six out of the 26 per 1,000?—It has a very material effect upon the death-rate for Skipton.

15,153. The population is 5,000. One death in a fortnight is exactly 26 in a year, and the death rate of the whole 5,000 is 26 per 1,000, and therefore the deaths in the workhouse are five or six out of the 26, which reduces the death rate proper to 20?—Yes; the mortality in the workhouse must have a very considerable effect upon the death rate in Skipton.

15,154. (*Chairman.*) Do you occupy any land in the valley of the Aire?—I do.

15,155. To what extent?—About 130 acres.

15,156. Is any of it land which has been improved by the Airedale commissioners?—Yes.

15,157. To what extent?—About 40 acres.

15,158. Did you occupy that land before the improvements were made?—I did.

15,159. And as the tenant of that land do you experience improvement from the works which have been executed?—As to the lower part of it, decidedly.

15,160. Is it pasture land?—Yes. The floods are less frequent than they were, and the water gets away more rapidly. Formerly if we had a considerable fresh the river would frequently be from 24 to 48 hours in getting down, and now it gets down in two or three hours, excepting in the case of an extraordinary flood, such as we have had lately.

15,161. Have you made internal drainage as well as improvement in the river itself so as to carry the water off from that land to a lower level?—Yes; the land was drained before the commissioners improved the river, but since the improvement of course our drains have had a better effect. You were speaking about impediments in the river and about the river silting up. We find by experience that in almost all places where the Aire has silted up currents or becks run into the river.

15,162. Nearly at right angles?—Nearly at right angles, or in any case where a considerable amount of wreck is brought into the river, and it is there that impediment generally takes place.

15,163. A deposit is formed at the mouth of the beck, and that creates an obstruction to the river Aire itself?—Yes; in almost every case the impediment has been caused by a brook in that way.

15,164. As commissioners you have executed some works to prevent this *débris* being carried into the river Aire, have you not?—Yes.

15,165. A kind of trap?—Yes.

15,166. What do you call them?—We call them gravel-traps.

15,167. Have those gravel-traps been successful?—Yes. Where the Glusburn beck enters the Aire there are three traps in succession, one above another. They are filling up now and want cleaning out. At Cononley Beck there has been no ground trap made, and the refuse brought into the river there is particularly heavy, because the beck comes from the Duke of Devonshire's lead mines. The deposit from that beck when it gets into the bed of the river remains there. It does not drift down in the same way as the loose gravel.

15,168. After the heavy flood the other day has much deposit collected at the mouth of that beck?—I have not been down since the water subsided.

15,169. If a considerable collection of gravel accumulated at the mouth of that beck the improvements which you have made might be almost negatived by this formation during a heavy flood?—Yes. They are about to make a gravel-trap there, but I think that the work is not yet contracted for. It is ordered to be done.

15,170. What do you consider to be the increase caused by the improvements in the annual value of the land which you occupy and which was subject to flooding?—The drainage will not be a success in a monetary point of view.

15,171. How do you account for that?—The works have cost more than they were expected to do, and the area to be benefited is much less than was anticipated.

15,172. But the health of the district is very decidedly improved?—Decidedly.

15,173. Do you know the district below Keighley?—Not very well. I have of course seen it, but I do not know much about it.

15,174. Are you aware that Mr. Ferrand and others think that you benefit yourselves at their expense?—I saw his statement, but I did not believe it.

15,174*a*. You admit that the water goes away from your district more readily than it used to do?—The old course of the Eller beck was from Skipton valley to the CarltonWood Bridge; a new cutting was made from near Skipton to a point below Carlton Stone Bridge, so that the water now discharges itself about a mile lower down the river than formerly, and in an ordinary fresh will be out of the district before the flood from the upper part of this valley joins.

15,175. So that you anticipate the flood, and discharge some of the water at a period previous to that at which it used to be discharged, and the result is that there does not come down so much in bulk as there did formerly?—The land which I occupy down the river is below the junction of the new cutting, and of course if any lands would be more subject to flood than others it would be just those where the river and the beck brought together. My first impression was that when that cutting was made we were doing away with the large reservoir above and should be more subject to flood, but in practice we find that the water comes down so much more readily that it gets away before the upper water reaches us, so much so that instead of having frequent floods we have only had two general floods since the river was altered. One was on the occasion of an excessive thunderstorm in the Aire after the river was diverted, and the other has been the present flood. Of course nothing could have saved us from either flood.

15,176. Has the present flood continued as long upon the land as a similar flood would formerly have done?—No; the valley below would have been a swamp for a long time to come under the old state of things.

SKIPTON.

Mr. B. H. Bradley.

29 Nov. 1866.

15,177. The water from it gradually passing off?—Yes.

15,178. Are you aware that the view which those below take of this district is that it is a kind of reservoir for them, and that the water formerly went down gradually and gave them power in a much more steady manner than it does now?—I had the same impression until I saw the new arrangement worked. I thought that the reservoir was being taken away, and that we should have flooding to a greater extent below, but that does not appear to be the case in practice.

15,179. (*Professor Way.*) I suppose that if any persons below are aggrieved it is open to them in like manner to arrange to pass the water on to somebody else?—Yes.

15,180. And improvement must not be retarded because some persons are behind others?—No. I think you asked Mr. Marsden some questions with regard to ague. About the year 1798 there were some works carried out in the Bradley Ings. Previously to that time I have heard people say that the inhabitants were very subject to ague in the valley, but it ceased to exist after those works were made.

15,181. (*Chairman.*) Those works expedited the clearing off of the water?—Yes; and now with the extra works you have a considerable diminution of fever. In fact there is scarcely any fever but typhus fever, which sometimes exists.

15,182. The first works removed the ague, and the second works removed fever?—Yes, so far as I can judge.

15,183. Where these banks exist on each side of the river Aire have you found the bed of the river rise in your recollection?—No. The rising of the bed of the river has been simply from deposit in the bed, so far as my observation goes.

15,184. (*Professor Way.*) Are you aware that ague has been disappearing from this country altogether in the last few years?—I merely speak of this locality.

15,185. Do you know that in the districts in which it formerly lurked it is not to be found now. There is a place at the mouth of the river Thames called Foulness where nothing has been done in the way of drainage, it was exceedingly subject to ague, but is not so now?—I cannot speak upon that point.

15,186. (*Chairman.*) Is the land which you occupy conveniently situated for taking the sewage of Skipton upon it?—No.

15,187. If you had land so situated should you be willing to take the sewage upon it?—Yes. I should be very glad to have an opportunity of doing so.

15,188. Do you think that you could apply it with advantage and without expense to the town?—Of course, if it was brought to me I could apply it with considerable advantage without expense to anybody.

15,189. Then you think that the whole expense which they would be at to apply their sewage would be in extending their sewer to the point of discharge?—I should think so.

15,190. And that then a farmer would be very willing to take the sewage and apply it to his land?—I should think so. I should for one; but I see here the agent of Sir Richard Tufton, who is the owner of nearly the whole of the land to which it could be applied.

15,191. Is there anything else to which you would wish to draw our attention?—I do not know whether you have exactly a correct impression about the new cutting in the Eller beck below the town, that is, before the Eller beck gets to the Aire.

15,192. Does that come within the district of the Airedale Improvement Commissioners?—Yes.

15,193. That was I think mentioned by Mr. Sidgwick?—Yes, I think that he named it. During the summers of 1864 and 1865 and the early part of 1866, which was dry, the mills above were able to hold back nearly the whole of the water of the beck, and then that cutting was left dry during the evenings, and the stench from it was very bad indeed.

15,194. The sewage was discharged into the bed of an empty stream?—Yes.

15,195. That would be an argument in favour of applying it to land?—Decidedly.

15,196. And, as a farmer, does it not rather grieve you than otherwise to see all that sewage going away and not being applied usefully?—I would much rather see it utilized. I do not know whether what I am about to mention is within your province, but the board of health in order to get rid of the refuse from their privies have made a receptacle about a quarter of a mile out of the town; the place chosen is as public a place as they could have it, it is almost where the Carlton Road leaves the Keighley Road. The soil is led there, and is deposited and remains there for weeks.

15,197. Is the place near any dwellings?—There are two very good houses, new buildings, which are unfortunately placed between that spot and the Eller beck cutting.

15,198. Have the persons residing in those houses applied to you as guardians for the removal of the nuisance?—No; they are within the jurisdiction of our improvement board and being members of the board of health they have the remedy in their own hands if they like.

15,199. If they signed a paper and sent it to you as guardians, you could inspect and order the removal?—No, we could not.

15,200. The remedy exists?—It exists, but it rests with the board of health.

15,201. (*Professor Way.*) After all, I suppose this is merely a transitory evil; it arises from the cleansing out of these privies, and the privies are in course of being abolished?—Yes.

15,202. But still you think that the cleansing might be done in a better way?—To lead the soil so near the town and to let it remain there is a nuisance.

15,203. Could it be disposed of directly for agricultural purposes?—There would be more cost to some one. They deposit it in the nearest place, and it remains there until it is required, and then it is fetched away.

15,204. And it remains there to its own injury, I suppose?—Of course, it wastes very much.

The witness withdrew.

Mr. A. Nicolson, C.E.

Mr. Angus Nicolson, C.E. (Skipton), examined.

15,205. (*Chairman.*) Are you a resident at Skipton?—I am.

15,206. I believe you are agent to Sir Richard Tufton?—I am his local agent.

15,207. You have charge of his land in the neighbourhood of Skipton?—Yes.

15,208. What extent of property does Sir Richard Tufton possess in this neighbourhood?—Land worth about 15,000*l.* a year.

15,209. Does much of the town of Skipton belong to him?—From one-fourth to one-third of the town.

15,210. Is the condition of the houses in that part of the town good?—Yes, it is very fair.

15,211. You are interested in any improvements which are recommended by the local board of health, and you see to them and have them executed?—Yes, they are carried out at once.

15,212. And in general are they, in your opinion, well carried out?—Yes, but I do not think that the system of sewerage has been well carried out.

15,213. What do you think is objectionable in it?—The design was very good, but it has been carried out imperfectly; in the first place, they used very inferior material in constructing the sewers; in fact, they have been constructed of the refuse of brick yards, and in forming the main sewers through the streets they plugged off all the old drains and did not form new drains till a long time afterwards, and some of them I have no doubt are unformed yet.

15,214. What is the stratification through which the sewer passed?—In some places clay, but to a great extent gravel.

15,215. And the refuse found its way into that gravel instead of into the sewer?—Yes, and came back into the houses.

15,216. Have you found cases where such an objectionable result has occurred?—Yes, some of them occurred to houses under my charge.

15,217. Was there illness consequent upon it?—Yes.

15,218. Cases which you know?—Yes.

15,219. Does the evil exist at present, or has it been remedied?—It has been corrected wherever we have found it to exist.

15,220. In what other way do you think that the system of sewerage has not been well carried out?—Many of the side drains which have been executed are stopped up, and are subject to stopping up; they do not act well.

15,221. There is not a sufficient fall?—I suppose so; they are not built with a regular gradient.

15,222. Do you think that to any great extent there is an accumulation of dirt between the houses and the sewers?—We have found it in some cases.

15,223. (*Professor Way.*) Are pipes used for the sewers?—Yes, in all side drains.

15,224. (*Chairman.*) And they are not well laid?—They are not.

15,225. Are those side pipes laid under the direction of the board of health?—Yes.

15,226. But the work has been inefficiently executed?—Yes, in many cases.

15,227. We have heard that the main sewers themselves are well flushed out; have you found that to be the case?—Yes; I believe that they are; we have an abundance of water.

15,228. Is the mischief of which you complain in the house connexions?—Yes; in the house drains.

15,229. Do you know the outlet of the main sewer?—Yes.

15,230. Does it discharge near Sir Richard Tufton's land?—On his land.

15,231. Is there land below that outlet which would be suitable for sewage irrigation?—Not immediately below, but the sewage could be carried by gravitation to land further down at some cost.

15,232. What length must the sewer be extended so as to reach that land?—200 or 300 yards.

15,233. 200 or 300 yards would take it upon the surface?—Yes, but deep cutting would be required.

15,234. What depth of cutting?—The sewage might be taken in two or three directions; but the plan where it could be used with the best effect would be lower down the valley southward; there is rising ground there so that I should think that a cutting of 15 feet would be requisite.

15,235. (*Professor Way.*) Could not the sewer follow the course of the stream?—The stream as diverted is in a cutting of 12 feet deep.

15,236. Supposing that pipes were laid near the bed of the stream, would there then be any necessity for deep cuttings?—Yes, because the stream is on a rising ground; in fact, there is a cutting formed for the stream.

15,237. Could not the pipe go in the stream itself without objection?—No; I do not think that that could be done.

15,238. (*Chairman.*) What do you think would be the cost of extending the sewer?—I am scarcely prepared to say that just now; the cutting is not bad.

15,239. Does the land which you say would be suitable belong to Sir Richard Tufton?—Yes.

15,240. Would Sir Richard Tufton be willing to have the sewage distributed over that land?—It depends upon the quality of the sewage matter; there is much water here; the rainfall is so great and so much water is used for domestic purposes, and so little sewage matter goes into the sewer, that I am doubtful whether the contents of the sewers would have a good effect upon the land; it is a subject for consideration.

15,241. (*Professor Way.*) I suppose that one reason why the system of waterclosts does not get developed to its utmost, is that it results in the fouling of the stream?—I think that there is another reason, namely, that we are generally short of water here in summer.

15,242. We understood from the manager of the water works that he could readily supply from 20 to 30 gallons per head all the year round?—Not in summer; we have been for months in summer almost without any water, with only a very short supply.

15,243. Supposing the sewage of this town to be carried on to the land, is it not probable that the water-closet system would be extended, so that you would get a stronger and more useful liquid for agricultural purposes?—Yes, if you had sufficient water.

15,244. One hangs upon the other to a great extent?—Yes; waterclosets become an injury if there is no water for them in summer; they become offensive, and instead of improving the health of the house, they are an injury.

15,245. (*Chairman.*) Your objection is that in summer there is not water sufficient to cleanse the waterclosets properly or to throw the matter on to the land, even if there was the land which would take it?—Exactly so.

15,246. And therefore you object to going to any expense to carry out sewage irrigation?—I am not sure that Sir Richard Tufton would go to expense in any case; it depends very much upon the analysis of the contents of the sewers.

15,247. (*Professor Way.*) In estimating the strength of the sewage, should you not look forward to the time when the water supply will be sufficient for watercloset purposes in summer as well as in winter, instead of adopting as a standard the present state of the water supply?—Precisely; sewage matter might be applied with advantage to land where the subsoil is porous, so that a large quantity of water laid upon the soil would pass off quickly, but land where the subsoil is clay would require a very expensive system of drainage before sewage could be applied with advantage.

15,248. (*Chairman.*) At Norwood, sewage is carried on upon stiff land with very great success?—We have a very wet climate here, and our land as a rule is saturated with water.

15,249. What is the rainfall in this district?—I should say about 45 inches.

15,250. Is that the average or does it vary?—I have never gauged it.

(*Mr. Heelis.*) Last year it was 32 inches, but that was an exceptional year; we were nearly burnt up. I believe that the average is about 36 inches.

15,251. (*Professor Way.*) (To Mr. Nicolson.) Would the rainfall be greater here than at Keighley?—I should say so; we are here surrounded by very considerable moors. The experiment could be very easily applied here; perhaps on an extent of land of 20 to 30 acres it could be tried at a very trifling cost.

15,252. Twenty-five acres would take the whole of your sewage?—We could obtain 25 acres for such an experiment, on which it could be tried without any cost for any cutting. I quite think that the experiment is worth trying.

15,253. (*Chairman.*) Have you ever considered the question of the management under which the river should be placed; or if the government deemed it requisite that rivers should not be polluted, have you considered what preventive measures might be successfully carried out?—I think that there should be some separate staff for the conservancy of the rivers, apart from local bodies altogether.

15,254. You would not leave it to Skipton to keep the sewage of Skipton out of the river?—By no means.

15,255. Under whom would you place the staff which you suggest?—If there was a national scheme for the purpose, I should think that there would be some central authority for regulating all the minor machinery throughout the country; but if the work was only done on a small scale, for instance, for Skipton alone, the matter might be left with advantage to the local authorities, to the board of health.

15,256. (*Professor Way.*) Taking the two districts

SKIPTON.

Mr. A. Nicolson, C.E.

29 Nov. 1866.

of the Aire and Calder, supposing that any measure passed the legislature for the purification or prevention of the pollution of those two rivers, would you think it right to have a local body as well as a central controlling authority, such as the county magistrates or any other body which might be suggested. You would not I presume like to be placed entirely at the disposal of the central authority?—I should think that the measure would be carried out more efficiently by being under the entire control of the central authority, because in many places the magistrates are the very parties who are most interested in works which pollute the river.

15,257. (*Chairman.*) You mean that many of the manufacturers are magistrates?—Yes.

15,258. But I think that from the experience which we have gained in this inquiry, the manufacturers themselves are very willing to carry out a system of prevention, if it can be shown how it is to be done, and if the system is general?—I am glad to hear it.

15,259. (*Professor Way.*) At all events those who themselves suffer from pollution, are not only ready, but anxious for a remedy which shall be applied to them simultaneously?—Many parties are anxious for remedies so long as they do not cost them anything, but if the remedy is a costly one they are not so eager to carry it out.

15,260. (*Chairman.*) Have you observed the works of the Airedale Improvement Commissioners?—I am one of the deputy commissioners.

15,261. Have you heard the evidence which has been given to us by Mr. Bradley?—Yes.

15,262. Do you corroborate that evidence?—I cannot say that I do in every respect.

15,263. In what respect do not you corroborate it?—I think that the whole scheme has been imperfectly carried out. The original design was a very good one, and had it been carried out it would have been a very great advantage to the valley, but it was only partially carried out, and at a cost considerably above the original estimate.

15,264. Then you think that there has not been so much improvement as there might have been?—By no means.

15,265. Do you think that there has been an improvement to a certain extent?—An improvement in some places and an injury in others.

15,266. Within the district of the Commissioners?—Yes.

15,267. Some parts of the valley are benefited at the expense of other parts?—Just so.

15,268. Do you think it probable that persons residing below Keighley have any ground to complain that, speaking generally, these improvements have been made at their expense?—I know very little of the country below Keighley; that is a thing which I cannot speak to.

15,269. But the water being passed off more rapidly from this district, may give rise to greater flooding below?—It is passed off more quickly from the upper and middle portions of the district, but lodges in the lower portion about Silsden.

15,270. Does not it pass off more quickly?—In some localities it does, and in others it does not. We have lands flooded now which never used to be flooded before.

15,271. Do you agree with Mr. Bradley as to the improvement in the health of the people residing upon the banks?—Yes, I believe that the work has had a good effect, especially about Kilwick and Cross Hills; they have derived more benefit than any other districts, because the surface of the river has been lowered to the extent of 10 feet by the removal of shoals; shoals are accumulated at the junction of the streams with the river to an immense extent, those districts have been very much benefited both agriculturally and in the health of the inhabitants.

15,272. Have you observed the action of the gravel traps?—I have.

15,273. Is it satisfactory?—So far as they go they act very well, but they are expensive.

15,274. What do you expect as a commissioner to have to do with the gravel which is collected in them?—I think that the gravel could be sold for different purposes; the larger gravel could be sold for road metal, and the smaller gravel and sand could be sold for garden and building purposes.

15,275. Do you think that there would be a sale for it?—Yes, in most districts.

15,276. Of course all that you can keep out of the river Aire is an improvement to the river generally?—Yes, it is of immense importance that the gravel should be trapped, because the shoals have been removed at very great cost, and they are now forming again in many cases.

15,277. You commissioners, I presume, are a continuous body?—Yes.

15,278. And it will be your duty to remove those shoals after such a flood as this?—Yes, we should do it.

15,279. Have you power to raise a rate upon the adjoining land for such purposes?—Yes, full powers.

15,280. Within what area does that power exist?—I think that the area is 1,200 acres.

15,281. How is it defined?—By plan and schedule.

15,282. Made before the works were executed?—Yes.

15,283. (*To Mr. Bradley.*) You have heard the observations made by Mr. Nicolson as to the improvement of portions of the valley by the works of the Airedale commissioners, and the injury done to others?—Yes. I presume that Mr. Nicolson means by the part which is not improved, some part where the works are not yet finished. I was asked the other day by Mr. Sidgwick, who is one of the commissioners, to go down to the Holden beck to observe the action of the river there, that was before the flood, and to see what I thought about a cutting being made there to relieve the land which has been referred to. It appears pretty clear that the actual drainage of that part of the valley is defective yet, but that by removing the impediments at the foot of the stream it would be considerably improved. I suppose that Mr. Nicolson refers to that point.

15,284. (*To Mr. Nicolson.*) As I understand you, your argument is this, that in the first place the works were very well designed, and that if they had been fully carried out you think that the result would have been beneficial to the whole of the valley?—Yes, very much so.

15,285. But you say that they have only been partially carried out, and that therefore they benefit some parts at the expense of others?—Just so.

15,286. Your argument would go to this, that the whole should be carried out as originally designed?—They have unfortunately in some places departed from the original design.

15,287. In order to diminish the expense?—Yes.

15,288. But that, I presume, was done with the consent of the whole commissioners?—With the consent of a majority of them.

15,289. Was the original design subject to the supervision of any Government officer?—No.

15,290. It was done by Act of Parliament?—Yes.

15,291. Have you under that Act the power of carrying out a part of the works or of altering them?—I cannot speak to that point; I think that it is questionable.

15,292. You are aware that there is now a land drainage commission; you know the Land Drainage Act which was passed a few years ago?—I do.

15,293. Commissioners are appointed under that Act?—Yes.

15,294. And changes made in drainage such as this, would now be submitted to them. An officer of the commission would be sent down to examine the locality and to say whether the plans were sufficient, and I rather think that the works must be carried out in accordance with those plans. You would approve of such a system in preference to this Act of Parliament under which you are now acting?—Decidedly, because works are too often made to suit estimates instead of public utility.

The witness withdrew.

SKIPTON.

Mr. JOHN CALVERT (Skipton) further examined.

Mr. J. Calvert.

29 Nov. 1866.

15,295. (*Chairman.*) You have heard the evidence which has been given by Mr. Nicolson?—I have.

15,296. You mentioned that you could supply, and did supply about 100,000 gallons a water a day to the people of Skipton?—That is about the average.

15,297. Mr. Nicolson mentions to us, that in the summer time you cannot supply that volume of water?—In a very droughty summer we could not supply that quantity.

15,298. What quantity were you enabled to supply in the summers of 1864 and 1865?—We were able to give a supply of five hours a day for two months, and for the remainder of the time a full supply.

15,299. Was that the case in each year?—In each of those two years.

15,300. (*Professor Way.*) Five hours each day would be one-fifth of the usual supply?—Yes.

15,301. It would be four gallons per head at that time?—Yes.

15,302. (*Chairman.*) Have you any note of the volume of water which was actually drawn off on those occasions each day for the use of the day?—I have not the particular measurement of it, but I have a certain mode of knowing what quantity of water passes each day into the town.

15,303. What was it then?—It would be about one-fourth of the quantity which is passing into the town at this time.

15,304. One-fourth of 100,000 gallons a day?—Yes.

15,305. That is 25,000 gallons a day?—Yes.

15,306. (*Professor Way.*) Is that the minimum on any one day?—Yes, during the time of the greatest drought.

15,307. That is the minimum supply during the driest time?—Yes.

15,308. (*Chairman.*) That would be five gallons per head per day?—Yes.

The witness withdrew.

Mr. T. Clarke.

Mr. THOMAS CLARKE (Skipton) examined.

15,309. (*Chairman.*) You are fireman of the gas works at Skipton?—Yes.

15,310. How many years have you been so employed?—About 17 years.

15,311. Where are the works situated?—At the railway station.

15,312. How many retorts have you?—24.

15,313. What quantity of coal do you use in a year?—1,000 tons I think is now the average.

15,314. What quantity of gas do you manufacture from it?—On the average about 10,000 cubic feet per ton.

15,315. How do you purify your gas?—With dry lime.

15,316. What becomes of the refuse lime?—It is contracted for by the farmers.

15,317. Do they take it away steadily?—Yes.

15,318. Have you at any time any accumulation upon the premises?—No, perhaps I have four or five cart loads.

15,319. You have not so much as to become a nuisance?—No.

15,320. Are your men healthy?—Yes, they are all healthy.

15,321. What becomes of your coke, have you a ready sale for it?—Yes, we can clear it out every day; we have a customer who will take the whole.

15,322. What becomes of the tar and other refuse from your manufacture?—It is contracted for; it goes to Upton, near Accrington, at present.

15,323. Does anything at present go from your premises into the beck?—No, I do not know that there is anything at present.

15,324. You do not pollute the stream at all?—No, all the liquid goes into the tar vats, and the ammoniacal vats.

15,325. And all is sent away for sale?—Yes.

15,326. At what price do you supply gas?—At 5*s.* 5*d.* for the small consumers, and for the large ones 5*s.*

15,327. (*Professor Way.*) Is not that a good deal for this district?—Yes.

15,328. What do you give for your coals?—Some of the coal is 1*l.* a ton.

15,329. But you use a mixture of coal?—Yes; the other coal would be about 14*s.* now, it is a little higher than it was.

15,330. Then the average cost is something like 16*s.* or 17*s.* per ton?—I daresay.

15,331. What do you now get for your tar?—I do not quite know.

15,332. Is it about 1*l.* a ton?—Yes, or rather more.

15,333. What do get for your ammoniacal liquor?—It is rather less; I do not know exactly the price.

The witness withdrew.

Adjourned to to-morrow at 11 o'clock at Pontefract.

Pontefract, Friday, 30th November 1866.

PRESENT:

ROBERT RAWLINSON, ESQ., C.B., IN THE CHAIR.

JOHN THORNHILL HARRISON, ESQ. | Professor JOHN THOMAS WAY.

PONTEFRACT.

JOHN ROUTLEDGE, ESQ. (Pontefract), examined.

J. Routledge, Esq.

30 Nov. 1866.

15,334. (*Chairman.*) Are you mayor of this borough?—Yes.

15,335. What is the population?—About 5,346.

15,336. This is a very ancient corporation?—Yes; it dates from the year 1484. It was incorporated by Richard III. in the second year of his reign.

15,337. Do you know the rateable value of the borough?—About 15,000*l.*

15,338. It is both a municipal and a parliamentary borough?—Yes, and it returns two members to Parliament.

15,339. Are the areas of the municipal and parliamentary boroughs the same?—No, they are different.

15,340. How is the local government of the borough carried on?—By the corporation and the street commissioners.

15,341. The street commissioners are an independent body?—Quite so.

15,342. You have not yet adopted the Local Government Act?—No.

15,343. You act under your old charter?—Yes.

15,344. The street commissioners, I assume, are a self-elected body?—Yes.

15,345. How many are there?—33.

15,346. Is the body regulated by a private Act of Parliament?—Yes.

PONTEFRACT.

J. Routledge, Esq.

30 Nov. 1866.

15,347. Have you carried out any system of sewerage in this town?—Yes.

15,348. Where is the outlet?—It runs into the canal.

15,349. What canal?—The Goole canal.

15,350. Then the main sewer empties itself into the canal?—Yes.

15,351. Have any complaints been made of this state of things?—No.

15,352. Are you quite content to let it go on?—No, for health's sake it ought to be prevented.

15,353. I suppose the canal is not very foul?—No.

15,354. Does the canal merely carry off the surface water of the streets?—The sewage is emptied into tanks at the lower end of the town.

15,355. What goes into the canal?—Part of that sewage.

15,356. The overflow?—Yes.

15,357. Is anything done with the sewage after it goes into the tanks?—It is put upon land occasionally; it consists principally of sand.

15,358. Are any manufactures carried on in Pontefract?—No.

15,359. Then you do not pollute any of these streams by manufacturing processes?—No.

15,360. Nor do you obstruct the streams by any solid refuse?—No.

15,361. You are not inconvenienced by flooding at all?—No.

15,362. Is there a water supply for the town?—Yes.

15,363. In the hands of a company or the commissioners?—The commissioners.

15,364. How long have those works been established?—For 14 years.

15,365. Were they established by Act of Parliament, or are they only permissive?—The street commissioners bought the property and sunk a well; the water is pumped up from a well.

15,366. You are apparently very little interested in the inquiry we are conducting as to the pollution of rivers?—No; we have nothing to do with it.

15,367. As a municipal borough you are not much concerned with it?—No.

15,368. How far is it in a straight line from Pontefract to the river?—About two miles to the point where the sewage runs into the canal. Originally some pipes were laid down to carry the sewage into the river Aire, but those have been blocked up for many years, the scheme never having been completed, and now the sewage runs into the canal.

15,369. It was contemplated, as I understand you, to run the sewage down into the river?—Yes; some pipes were laid down under the canal to be carried into the river.

15,370. (*Mr. Harrison.*) Is Knottingley included in the parliamentary borough?—Yes.

15,371. And Castleford?—No.

15,372. (*Professor Way.*) Did you state that the sewage runs into tanks?—Yes.

15,373. But that it overflows from them?—Yes, and runs into the canal; it has two miles to run before it goes in.

15,374. Is it treated in any way with any substance to precipitate it?—No.

15,375. It merely deposits what it will deposit and then runs off?—Yes.

15,376. Are these tanks large?—Yes.

15,377. What size are they?—I do not know.

The witness withdrew.

Mr. E. Fernside.

Mr. Edwin Fernside (Pontefract) examined.

15,378. (*Chairman.*) What are you?—I am superintendent of the borough police and inspector of nuisances.

15,379. For the municipal borough?—Yes.

15,380. What number of houses are there in Pontefract?—I do not know.

15,381. Eight or nine hundred?—I cannot say. (*The witness subsequently informed the Commissioners that there were* 1,202 *houses in Pontefract.*)

15,382. How long have you acted as inspector of nuisances?—Upwards of 10 years.

15,383. What are your duties?—To inspect nuisances and to report to the sanitary committee.

15,384. Under the Nuisances Removal Act?—Yes.

15,385. Have many waterclosets been constructed in the borough?—Yes, 175 waterclosets have been constructed.

15,386. In what class of property?—Generally in the better class of dwelling houses and public buildings.

15,387. How is the sewage passed away?—It goes into the main sewer, which empties itself into the Aire and Calder canal.

15,388. After passing through some tanks?—Yes.

15,389. Are there many common privies and ashpits in the poorer class of houses?—Yes. There are 736 privies.

15,390. Where are they situated, generally speaking?—Generally behind the dwelling houses.

15,391. Are any of them placed under sleeping apartments or rooms in which there are occupants?—There are a few, I believe.

15,392. Do not you know the fact?—I know that there are several.

15,393. Do many of the poor people keep pigs?—No; what is called the pig nuisance has been a good deal suppressed by the sanitary committee.

15,394. It was a much greater nuisance than it is now?—Yes.

15,395. Have you caused the nuisance to be removed?—Yes.

15,396. Do the corporation take any cognizance of buildings about to be erected?—No.

15,397. Does anyone build a house as he likes?—Yes.

15,398. Have you ever to complain of buildings being too much crowded together on a given space of ground?—I have had occasion to complain of some of the lodging-houses, of people keeping lodging-houses without being duly registered or licensed, and in such cases the offenders have been brought before the magistrates and punished under the provisions of the byelaws.

15,399. How many common lodging-houses are there within the municipal borough?—18.

15,400. For how many lodgers are they registered?—I can produce my register; I cannot say from memory.

15,401. Let me look at your register (*the same was handed to the Chairman*). Do you find any difficulty in carrying out the powers of the Act?—None whatever.

15,402. When you first commenced to put the Act in force did you find any difficulty?—No.

15,403. In what condition are the lodging-houses now as compared with what they were when you first began?—They are in a very satisfactory state.

15,404. Better than when you first began?—Yes, they are cleaner.

15,405. Do you compel the tenants to whitewash them when they require it?—Yes.

15,406. How many times a year?—Twice a year.

15,407. Do you also see that there is proper ventilation to the rooms when occupied?—Yes.

15,408. And a proper separation of the sexes in the lodgings for single persons?—Yes; under the recent Act of Parliament every day every lodging-house in the town is visited, and a report is made out similar to that (*handing in the form*).

15,409. I perceive in this return that one house is licensed to take in 32 persons?—Yes.

15,410. Another is licensed to take in 12?—Yes.

15,411. Another is licensed for six, another for eight, and another for ten?—Yes; this (*handing in the same*) is a copy of the printed regulations.

15,412. A great many of the lodgers, I believe, are not what you would term vagrants, but men on the tramp?—Very many of them are.

15,413. You have hawkers, labourers, gasfitters, tailors, shoemakers, saddlers, glass blowers, and an ink-maker and his wife. These are persons moving from one town to another on the tramp seeking for employment?—Yes.

15,414. They go to these lodging-houses as the only place of resort they have?—Yes.

15,415. What have they to pay a night?—3*d.* a night.

15,416. I suppose they are made to pay before they go upstairs?—Yes, I believe that is the rule generally.

15,417. What are the nuisances that trouble you most in this town?—The street grates are perhaps the greatest nuisance I have to contend with.

15,418. You mean the gullies?—Yes.

15,419. Do you perceive a bad stench arising from them?—Yes.

15,420. Do you know what shape the sewers or the drains are, square or circular?—The main drain is egg-shaped. I mean the new one.

15,421. When was it made?—It was made a few years before I came here, which was in 1856. I think it must have been in 1853 or 1854.

15,422. Of what shape are the tributary drains?—They are generally circular, I think.

15,423. Would you not infer that there must be something foul in the drains that causes the smell to come up through these grates?—The smell coming from the grates I would account for in two ways. In the first place, there is not a sufficient quantity of water to flush them out properly, and in the next place I think that they might be improved materially if a shaft was constructed to take away the foul air.

15,424. Do you think that the sewers are not properly ventilated?—Yes.

15,425. Are complaints ever made to you of bad smells getting into houses through waterclosets?—Yes, frequently in summer time and fine dry weather.

15,426. And occupants are suffering annoyance inside their houses?—Yes.

15,427. Have any complaints been made of nuisance arising from the outlet tanks into which the sewage goes?—No.

15,428. Whose duty is it to empty the ashpits?—They are emptied by private individuals, the owners or occupiers.

15,429. You do not empty them on behalf of the borough, but you give the parties notice to do so if the privies get very foul?—Yes.

15,430. Are the contents taken by farmers out into the country?—Yes.

15,431. Are there many slaughter-houses in the town?—I believe about half a score.

15,432. Have you much trouble with them?—Very little.

15,433. Are they drained into thesame sewer?—Yes.

15,434. I suppose the washings from the slaughter-houses, the garbage, and blood are all carried away?—Yes.

15,435. And pass down to the outlet?—Yes.

15,436. If such matter as that were to accumulate in the drains in hot weather I suppose it would help to produce a bad smell?—Yes.

15,437. During last summer did you use any disinfectant of any kind?—Yes.

15,438. Was that provided by the corporation?—Yes.

15,439. What disinfectant did you use?—Carbolic acid and chloride of lime.

15,440. Was there any cholera in the town during last summer?—I believe not a single case within the borough.

15,441. Has there been any fever of any kind?—Yes, a sort of low fever has been rather prevalent amongst cottagers.

15,442. Has there been any fever near any of those places where you say bad smells have been complained of?—Not particularly.

15,443. Where does fever usually occur?—I have known it to occur in very well ventilated houses and in healthy neighbourhoods. It has not been confined to the worst-drained districts.

15,444. Does much fever occur in the common lodging-houses?—Not very much.

15,445. Did you know those lodging-houses before they were registered?—Yes, some of them.

15,446. They were not under your supervision then?—No.

15,447. How long have you been in the police?—18 years.

15,448. Did your duties ever take you into those common lodging-houses 18 years ago?—Yes.

15,449. What condition were they in then?—I was not here at that time; I was in the Cheshire county constabulary before I came here, but I consider that the lodging-houses are very much better now in consequence of the daily visit that I cause to be made to them.

15,450. In order to see that the tenants comply with the regulations which are pasted up in each room?—Yes.

15,451. Do the lodgers ever draw your attention to the regulations, and point out to you that they have not been properly carried out?—Yes, in one or two instances, but not as a general thing.

15,452. Have they ever complained of the bedding being dirty?—No. The last complaint that I heard was of a male and female sleeping in one room. It is contrary to the provisions of the byelaws, and the parties were summoned before the magistrates for allowing it.

15,453. By whom was that complaint made?—By a fellow-lodger.

15,454. Male or female?—A male.

15,455. (*Professor Way.*) Do you find that carbolic acid is a good disinfectant?—I like the lime better.

15,456. Does the effect of carbolic acid soon pass off?—No, not very soon.

15,457. What is your objection to it?—It has been tried here by the medical inspector, and he said that he thought lime was better; I thought so too.

15,458. Is it used in the urinals?—Yes, and in the ashpits and privies; it is also put down the grates.

15,459. Is it put down through the gratings?—Partly so.

15,460. Is it also put down into the gully holes?—Yes.

15,461. (*Mr. Harrison.*) Where does the canal lead into which the sewage is discharged?—It is what is called the Aire and Calder canal, and it leads to Goole from here; it is between Goole and Leeds.

15,462. Does it go down to Knottingley?—Yes.

15,463. Does it pass through the town of Knottingley?—Yes.

15,464. The canal which passes through the town of Knottingley receives the overflow of the sewage of Pontefract?—Yes.

15,465. It does not reach the Ouse till it discharges at Goole?—I think it is connected in some way with the river.

15,466. Would it not foul the water more or less all the way from this to Goole?—Yes, I think so.

15,467. Have any complaints been made at Knottingley of the condition of the canal in consequence of the sewage of Pontefract being turned into it?—I never heard of any.

The witness withdrew.

Mr. Joseph Horn (Castleford) examined.

15,468. (*Chairman.*) Are you the proprietor of certain mills in the town?—Yes.

15,469. What business do you carry on?—Flint grinding, and the manufacture of whiting.

15,470. Where are the works situated?—One at Oulton and the other at Castleford.

15,471. What power do you use?—It is water power at Oulton and steam at Castleford.

POMFRET. *Mr J. Horn.* 30 Nov. 1866.

15,472. What amount of water power do you use?—It is called a 20-horse water-wheel.

15,473. Where does the water come from?—From the river Aire; the mill is on its banks.

15,474. Do you get the water by a side cut?—No, from the river itself; we have a goit.

15,475. Is there a weir across the river at that point?—Yes.

15,476. What fall is there to it?—About 7 feet 6.

15,477. Of what width is your wheel-race?—8 feet 4 inches I believe, or 8 feet.

15,478. The wheel, I suppose, is ground shot?—About half way up, nearer the centre than the bottom; I think it is 18 feet, the power is obtained underneath.

15,479. How long have you worked that wheel there?—I went there it will be 30 years ago in April next; we began to work the wheel then. I have been away since then.

15,480. Is the power as good now as when you first began to work it?—I do not know that there is any difference in it.

15,481. Does your tail water get away as readily as it did?—Yes, much the same.

15,482. Then the river has not altered in its character so as to injure your power?—I think not.

15,483. Is the river navigable now?—No; now they have the canal. The river used to be navigable above 30 years ago, but they cut the canal at the same time, I believe, as the Goole canal.

15,484. Is the river bed raised above you or below you?—Yes, they have to dredge sometimes for us, so that we can get a boat down to the mill.

15,485. The river is kept in order by dredgers at its proper depth?—Yes, only just at that point, about 100 yards from the lock down to the mill.

15,486. Is the river polluted by manufacturing refuse thrown in above you?—Yes.

15,487. By what is it polluted?—The greatest cause of the pollution is the Leeds sewage.

15,488. The sewage of Leeds comes down to you?—Yes, and since that has been put in we cannot get any fish; before that we could get quantities.

15,489. The sewage has killed the fish?—I suppose so.

15,490. Do you know when the Leeds outfall sewer was completed?—I do not know exactly. I left the Fleet mills about 18 years since, and the sewer was not in then, but when I went back again seven years since it was in.

15,491. Do you think the river is more polluted now than it was when you first knew it?—Yes, a great deal; I used to bathe in it formerly, sometimes twice a day; we could drink the water then, but I should not like to drink it now.

15,492. Where is the other mill situated?—At Castleford.

15,493. Is that a steam mill?—Yes.

15,494. Is that mill near to the river?—It is close to the river side.

15,495. Why do you use steam power there?—Because we have no fall.

15,496. What amount of coal do you use there per annum?—40 or 50 tons a week.

15,497. What do you do with the ashes?—We put them into a field; we used to put them on the bank-side to fill up.

15,498. Did you ever put them into the river?—They swam into the river in flood time.

15,499. You placed them very convenient for the flood to reach them?—Yes.

15,500. Did any person object to that at any time?—The Aire and Calder Company mentioned it once or twice to me.

15,501. To your knowledge do any persons put ashes into the river in your district?—I do not know that they do; they wash in, I believe, sometimes; but not to make a practice of it.

15,502. Does the sewage from waterclosets or privies go into the river?—At Castleford the sewage runs in.

15,503. Direct?—I believe so. Formerly we had two tanks, but they are done away with now.

15,504. What is the population of Castleford?—About 4,000 now; I am not quite sure about it.

15,505. How long has the manufacture at Castleford Mill been carried on?—The mill was built in 1849.

15,506. What number of men do you employ there?—10 or 11; it is not a very large mill.

15,507. Does the ground flint go into the Potteries?—Yes, for common ware; it is at Castleford and Ferrybridge where it is used, not for glass.

15,508. They use flint dust for bedding the best China in before it goes into the fire?—I believe they do.

15,509. Where does the whiting which you manufacture go?—A good deal of it goes to Manchester, to Leeds, and Halifax.

15,510. Is it calcined limestone?—No, it is ground, washed, and then dried.

15,511. (*Professor Way.*) How do you separate the flint after grinding it; do you put it in water?—First of all we wash it after grinding it, then it goes into a cistern to settle, and then we let the water off.

15,512. How do you dry it?—We put it on to a kiln to dry, but we dry very little; it is generally sent out in tubs.

15,513. And the same with the whiting?—No, that is all sent out dry.

15,514. Did you ever hear of a plan that is used in the Potteries for separating the clay from the water?—Yes, and they use that at Castleford.

15,515. Where is it used?—At Hartley and Company's.

15,516. Does it answer?—I believe that it does to a certain extent, but I am not sure about the name.

15,517. Have you ever seen it used?—Yes.

15,518. The water is forced in from the clay with a pump, is it not?—Yes.

15,519. Do not you think that the machine would be useful in making your whiting?—We could not make the whiting dry enough; we can do it by settling; we pump it on to the kiln to dry, and that is all one trouble of course.

15,520. (*Mr. Harrison.*) How are you supplied with water at the mill?—From the river.

15,521. Is the mill where you use water power on the Aire?—Yes, the water comes from the river; all the water that we use is from the river.

15,522. Do you use the same water also for domestic purposes?—No, we have a well for that.

15,523. Do you get good water from that well?—Yes, it is good water, but hard; we cannot wash with it.

15,524. What depth is that well?—I should think about three or four yards; it is filtered out of the sand.

15,525. Are there many persons residing on the banks of the Aire near to the mill, between Leeds and the junction of the Aire with the Calder?—No, Hunslet is the principal place below Leeds; then there is the Thorpe Hall colliery, and there are, I believe, 50 or 60 houses close to the river side there. Near to the Fleet mill we have 12 or 14.

15,526. Are they generally supplied with water for domestic purposes as you are?—I do not know how they get water at Thorpe Hall, but many persons get it from our pumps at Fleet mills. There are two wells, but ours is considered the best; it is inside the house.

15,527. Is the condition of the river at your mill sometimes very disagreeable?—Yes, it is very bad indeed in dry, hot weather. It is so bad that it glazes the outside of the doors, and inside the mill, and what ought to be white is perfectly black coloured.

15,528. Does it affect the health of the people there?—I cannot say, but I know that in the morning I do not like it.

15,529. (*Chairman.*) Has it any effect upon white paint?—Yes, it blackens it.

15,530. (*Professor Way.*) I suppose you cannot use the water of the river for grinding the whiting?—The water with which we grind the whiting we use over again often. When it is very bad it makes the whiting rather dark coloured.

15,531. You do use it then in the first instance?—Yes.

15,532. Then the dark particles in the water are apt to mix with the whiting?—Yes, and they settle with the whiting.

15,533. In grinding the whiting you run off the finer parts and let the liquid settle?—We have edge stones, and the liquid keeps running out when it gets to a certain height.

15,534. Does the material eventually all get fine?—No, we have a certain part that we grind by another process, not washing.

15,535. You ultimately grind it all down, do you not?—Yes.

15,536. There is no residue from it?—Only what falls on the floor.

15,537. Where does the material come from?—From a place near Hull.

15,538. Is it chalk?—Yes, it is hard chalk.

15,539. Are flints found in the same bed?—No, not those that we use; we use black flints for pottery. Flint out of the same bed would be too coarse.

15,540. Is it a very expensive process to grind flints?—Yes, it requires very strong machinery, and accidents often happen.

15,541. Are the flints ever calcined before they are ground?—Yes.

15,542. And thrown into water?—No, it would not suit to do that; they would want to be thrown in red hot; if we threw water over we should spoil the kiln.

15,543. The flints would not be red hot when got out of the kiln?—No.

15,544. You have spoken of the pollution of the river by the Leeds sewage, and that that has occurred within the last 20 years?—Yes.

15,545. Has the number of manufactories on the river increased in the last 20 years?—Yes, I should think there are three or four more on the river than there were 20 years ago.

15,546. But I mean at Leeds?—I think there were as many on the river side before, but manufactories have got up the becks.

15,547. Do you think that any part of the increased pollution is owing to the dyeing processes which have been carried on in the last 20 years?—I cannot say. Of course we had the pollution from the dye-houses when I went there first to a great extent, but it is a great deal worse now than it was before the Leeds sewage went into the river.

15,548. You cannot say exactly what causes have contributed to make the river worse?—No; but one thing I can say, which is, that when we are short of soft water for washing purposes we are obliged to take water out of the canal in preference to the river; the water is a great deal clearer in the canal than in the river, for the Leeds sewage comes in below the point where the canal is fed. That strengthens my opinion about the Leeds sewage.

15,549. I suppose the objectionable materials in the canal fall to the bottom to a great extent, whereas when in the river which is in motion they would not fall in the same way?—I cannot say, but a great deal does fall into the river; we have a lock close to us, and in a flood time, as just now, the river is filled up for above a foot outside the lock, and the stuff will not go away of itself; it must be pushed away by boats, or flooded away from the lock.

15,550. (*Chairman.*) Do you break your flints by hand?—No, they are broken by stampers.

15,551. Have you seen the new machine which has been invented for stone breaking?—No, but I have heard of it.

15,552. (*Professor Way.*) Do you use only stampers, or do you use an edge runner afterwards?—No, we only use stampers; we have a grate that the flint particles go through, and when that is done we can grind it.

15,553. You do grind it eventually?—Yes, but we stamp it first. The jaws of the new machine would not make it much finer. Our flint must be almost as fine as cream.

15,554. Do you grind it in water?—Yes.

15,555. (*Chairman.*) Does the pan revolve or the stones?—For flint grinding we have the Derbyshire chert, and we push the chert forward with arms and pave the bottom, and then we have runners at the top and push forward the arms; our stones for making whiting run round; the bottom is a fixture.

15,556. Did you ever see Dr. Clarke's process for softening hard water by throwing lime into it?—No, but we make the water that we use softer by washing the whiting in it.

15,557. The whiting combines with the lime in the water and takes it up if there was any in before?—Yes.

15,558. And the water when it goes away is softer than it was before?—Yes.

15,552. (*Professor Way.*) If you were in a chalk district where the water was hard you might be able to soften the water and get the whiting in proper condition; here it is comparatively soft water?—Yes.

15,560. (*Chairman.*) How much whiting do you make in a day?—Sometimes six tons. There is one nuisance that I think I ought to mention which comes from a brewery about about a mile above us.

15,561. What is the name of that brewery?—Oulton brewery.

15,562. How long has it been established?—I should think about 30 years.

15,563. Is the nuisance you speak of worse now than it was before?—Yes; the volumes of water from the washing of the barrels and the malt and those things is three or four times as big as it used to be; it is almost too much to bear as one is walking by the side of the drain; that refuse goes into the river Aire below our mill at Fleet, but above Castleford.

15,564. How does it happen to be an annoyance to you?—There is a foot road and a cart road which go past the drain, and we have to pass it nearly every day; I mention this because it pollutes the river.

15,565. The refuse is simply, I suppose, the washing of the barrels and the floors and the waste refuse that comes away?—Yes.

15,566. Do they send waste hops down or waste grains with it?—I do not know, but they lead waste hops away to a field which cause a very bad smell.

15,567. Waste hops which are thrown out and then get old and putrid are very offensive?—They are. I know that they smell very badly.

15,568. (*Professor Way.*) I suppose a sour kind of smell is brought down the river from the brewery?—No, but it is very bad; it is not quite so nauseous as the smell from the river, but it is rather worse to bear for the nose; the river smell is more sickening than that from the brewery drain.

15,569. (*Chairman.*) And you say that refuse from the brewery is one of the causes of pollution at present?—Yes; I should say that it makes the river worse for the Castleford people.

15,570. Where do the Castleford people get their water?—At first when I was there a great many of them got it out of the river, and many of them made tea of the river water then, but they cannot do so now I think. We have had several talks about a water supply for Castleford, but they have never got it yet; it is much wanted.

The witness withdrew.

Mr. Henry John Coleman (Pontefract) examined.

Mr. H. J. Coleman.

15,571. (*Chairman.*) Are you town clerk of Pontefract?—Yes.

15,572. In whose reign was your first charter granted?—In the reign of Richard the 3rd.

15,573. You have many charters I believe?—Yes.

15,574. Does the corporation hold any corporate property?—Yes.

15,575. Of what does it consist?—The market-hall and the town-hall.

15,576. Did the corporation acquire the market

PONTEFRACT.

Mr. H. J. Coleman.

30 Nov. 1866.

tolls by purchase?—No; they have belonged to them from time immemorial; they were first granted by charter.

15,577. Is the corporation lord of the manor as to manorial rights of Pontefract?—Yes; but the corporation has not exercised any such rights.

15,578. For instance, in taking market tolls?—Yes, they have been granted by charter.

15,579. That is a sort of manorial right?—Yes.

15,580. In other places market tolls are usually paid to the lord of the manor?—Yes.

15,581. Have you the privilege of regulating markets and fairs?—Yes, at least the mayor, who is clerk of the market, has all those privileges.

15,582. Has the market-hall been built out of any surplus fund that you have had, or have you borrowed money for that purpose?—We sold land and raised money in that way. We borrowed money as well.

15,583. Is the income sufficient to pay the current expenses and the interest of the money, and to leave a surplus?—Yes.

15,584. Does the corporation possess any other corporate property?—No.

15,585. Do you make the mayor an annual allowance?—No.

15,586. Of what number of members does the corporation consist?—16, and the mayor; four aldermen and 12 common councilmen.

15,587. Of course you are under the Municipal Corporations Act?—Yes.

15,588. Your corporation was reformed in 1837?—Yes.

15,589. Did that leave you with the same number of members?—No, it increased the number, originally there were 13.

15,590. Of what area does the municipal borough consist in acres?—I cannot say.

15,591. Are the boundaries now what they were before the Municipal Reform Act was passed?—No, they were regulated by that Act.

15,592. Is the municipal area co-extensive with the parliamentary area?—No.

15,593. What is the difference?—It is very great.

15,594. Your parliamentary borough, I suppose, is much larger?—Yes, it takes in all the township of Knottingley.

15,595. Were the limits of the parliamentary borough settled by the Municipal Reform Act in 1832?—No; the boundaries were settled when the Parliamentary Reform Act was carried out.

15,596. Was the borough boundary settled at that time?—Yes.

15,597. Did Pontefract send two members to Parliament before the Reform Act was passed?—Yes.

15,598. It retained its members, and had its area extended to increase the number of voters?—Yes.

15,599. Have you anything to do with the improvement commissioners?—No, I am not their clerk.

15,600. What other property does the corporation possess?—I have mentioned the town-hall.

15,601. Do they own any land now?—No, we sold the land for the purpose of the market.

15,602. Then you have no source of corporate income other than what comes from the rents of the market?—There is the borough rate.

15,603. Is that levied by the commissioners or through them?—No, the rating is done through the corporate body.

15,604. Do you think it is advisable to retain two separate systems of government in one small borough?—I hardly know how to answer that question; there are so many different opinions about it from so many clever men. I do not like to answer it.

15,605. The recent practice has been to consolidate local government under a corporation where it exists?—Yes, and I should think very properly so too in many cases.

15,606. If your corporation chose to adopt the Local Government Act they might, by an order in council, get the commission extinguished?—But that would be very much opposed.

15,607. Up to last session there were 15 local governing bodies in the municipal area of Leeds, but they went to Parliament for a bill, and they are now all consolidated under the corporation?—So I understand.

15,608. You have nothing to do as a corporation with the sewerage of the borough?—No.

15,609. Nor with street cleansing?—No.

15,610. Are the police under your authority and control?—Yes, they are under us, under the watch committee.

15,611. Is the town lighted with gas?—Yes.

15,612. By a private company?—Yes.

15,613. Is the town supplied with water by the commissioners?—Yes.

15,614. The corporation has nothing to do with either gas or water?—No.

15,615. Has the gas company to give you notice when they want to break up any streets?—No, the notice would be given to the street commissioners.

15,616. Do you, as a corporate body, keep a surveyor?—No, we have nothing to survey.

15,617. There are the mayor, four aldermen, and 12 common councilmen, a recorder, and yourself as town clerk?—Yes; but there is a separate Court of Quarter Sessions.

15,618. Do they meet monthly?—Yes, at least they did, and more often than that.

15,619. Have you anything to do with sanitary matters?—No.

15,620. Nor with river pollutions?—No.

15,621. (*Professor Way.*) Is the inspector of nuisances under your control?—Yes, he is.

15,622. Supposing he reports a nuisance connected with the water supply, in what way do you deal with that matter?—I do not know, but if there was a deficiency he might report the matter to the street commissioners.

15,623. Suppose he found that waterclosets had not been sufficiently cleansed?—That he would lay before the street commissioners; they have the sole control over the water.

15,624. Is he an officer of theirs as well as of the corporation?—No; he would act under the sanitary committee, and report the case to that committee; they would take cognizance of that.

15,625. Has such a complaint to go through your hands?—It would come before the magistrates if the parties did not obey the sanitary committee.

15,626. (*Mr. Harrison.*) The sanitary committee I suppose is in connexion with the corporation?—Yes.

15,627. If they interfered they would complain to the commissioners?—I suppose they would do so.

15,628. (*Professor Way.*) In such a case as that the inspector would have to report to a body to which he is in no way subordinate?—He is partly, because the sanitary committee is formed out of the corporate body.

15,629. (*Chairman.*) May the same gentleman be a member of the commission and a member of the corporation at one and the same time?—Yes, that is so.

15,630. Then the mayor may be mayor of the borough and chairman of the commissioners if so elected?—Yes, and it often happens; I believe that the present mayor is one of the commissioners.

15,631. I assume that the commissioners take their seats by qualification?—Yes.

15,632. They qualify as ratepayers and owners of property?—Yes.

15,633. Is there a double qualification?—No; there is a certain number of persons who are eligible, those who are most highly rated to the poor.

The witness withdrew.

Mr. Thomas Wordsworth (Pontefract) examined.

PONTEFRACT.
Mr. T. Wordsworth.
30 Nov. 1866.

15,634. (*Chairman.*) Are you one of the street commissioners?—Yes.

15,635. How many members constitute that commission?—Thirty-four for Pontefract and four for Tanshelf; they all manage the park, but the streets are under the control of the Thirty-four Pontefract commissioners.

15,636. Do they act under a private Act of Parliament?—Yes.

15,637. What is the date of your last Act?—It was about 80 or 100 years ago.

15,638. Is the sewerage of the borough under your charge?—Yes.

15,639. And the paving?—Yes.

15,640. And the cleansing?—Yes.

15,641. Do you exercise supervision over the lighting?—No; except that we pay for the lighting, and we contract for the gas and require the parties to fulfil their contract.

15,642. That is to say you enter into contracts with the gas company?—Yes, for lighting the streets.

15,643. Do you act with regard to the rating in conjunction with the corporation?—No, independently.

15,644. Are you a member of the corporation as well?—No.

15,645. Is there a surveyor employed under you?—No.

15,646. Have you any idea what money you expend in rates for town purposes?—About 900*l.* a year.

15,647. If you have no surveyor, how do you manage with regard to paving and cleansing?—The executive, who are appointed at the first annual meeting, manage that; we manage it amongst ourselves as commissioners.

15,648. Do you elect the improvement committee?—There are three whom we call the "executive," and who are elected every year.

15,649. I suppose your accounts are properly audited?—Yes.

15,650. Have they to be laid before an annual meeting of the commissioners?—Yes.

15,651. Not before any outside body?—No.

15,652. Have you to account to any persons?—No.

15,653. Not to the corporation?—No.

15,654. Only to yourselves?—Yes.

15,655. Are you elected by the ratepayers?—A number of those most highly rated, having freehold property, become commissioners.

15,656. That is if they choose to qualify?—They always do. I never knew an exception.

15,657. If they do not choose to qualify there is no compulsion?—I believe not.

15,658. Would their names be put upon the list of commissioners as the largest ratepayers, whether they chose to act or not?—Yes; the clerk makes out a list annually, and invariably the new members appear and take the oath which the Act requires.

15,659. They are summoned when they are put on the list, and they usually attend?—Yes.

15,660. Has any discussion taken place as to the propriety of vesting larger powers in the corporation?—Yes, about two years ago, and the great majority of the commissioners refused to relinquish their claim to the powers they exercised.

15,661. Have any complaints been made to you, as the board of commissioners, with regard to the outlet sewer that has been spoken of, and as to the tanks?—No.

15,662. You have a public park, have you not?—Yes.

15,663. Of how many acres does that consist?—About 360.

15,664. Is that part of some common that existed formerly?—Yes.

15,665. How long has it been made into a park?—I think 150 or 200 years.

15,666. Is the right to the soil vested in the commissioners; is it their freehold absolutely?—No. I cannot give the legal term, but I think it was a gift to the town for a certain purpose from the Duchy of Lancaster in some former period.

15,667. Could you build upon it, or lease it for building purposes?—No, I believe not.

15,668. You can only use it for park purposes?—Yes.

15,669. Are cattle grazed upon it?—Yes.

15,670. Who has that right?—Every inhabitant, after three years residence, has the privilege of putting on one cow or one horse; for a cow 12*s.* are paid, and for a horse a guinea.

15,671. They have to pay that?—Yes.

15,672. Are there many applicants for that privilege?—Yes, there are about 280 every year.

15,673. Can you accommodate that number upon that acreage?—Yes.

15,674. The funds collected, I presume, go to maintain the park?—Yes, for manure and herdsmen, and to make little improvements.

15,675. Is there a surplus from that source that can be applied for any other purposes?—No; if there is any surplus it is spent in manure.

15,676. For the land?—Yes.

15,677. Is any portion of it ploughed up?—No, it is all grass land.

15,678. Is the park laid out ornamentally?—There has been a little done in the past few years, and I think there will be more done.

15,679. Who is the lord of the manor here?—The Earl of Harewood.

15,680. Could you as commissioners break the surface for the purpose of getting gravel or clay, or rock, or if there was coal underneath could you work it?—The Act is very clear as to what the duties of the commissioners are, and I think we could not.

15,681. In the event of your wishing to carry out any system of sewers should you employ a surveyor or architect to devise and lay out the works?—Yes.

15,682. To see that they were properly executed?—Some one would be appointed if it was a large undertaking, but if it was only a trifling thing costing 20*l.* or 30*l.*, or 50*l.*, I think not.

15,683. Did you hear the inspector of nuisances state that he thought the sewers were not properly ventilated?—Yes.

15,684. Have you as commissioners power to remedy that state of things?—Yes.

15,685. Would it be worth your while, do you think, to bring that before the Commission, quoting the opinion of the inspector of nuisances, which I can very strongly confirm, that if there is no ventilation, ventilation should be made?—I believe that our great defect is want of water.

15,686. If you have foul gas in the sewers, which escapes through the gratings, you do not make it less by confining it, but you intensify it and make it more deadly, whereas, if proper openings were made to allow the gas to escape, less mischief would arise from it?—There has been a talk amongst the commissioners about building a chimney in some part, but it has never been accomplished yet. The commissioners are anxious to do everything they can for the good of the town, and they always have been.

15,687. I may state that unventilated sewers are simply dangerous abominations?—The complaints about the grates have been very trifling. I am aware that there have been some.

15,688. Any town that is sewered and drained, but in which the sewers are not ventilated, is in a worse condition than if it had all its refuse on the surface of the streets, and if bad smells escape through the gratings and gully-holes it is a certain proof that the sewers are not fully ventilated?—I am aware that some complaints have been made.

15,689. (*Mr. Harrison.*) At the present time you turn the sewage into the canal, and that canal passes through Knottingley?—Yes.

15,690. And consequently the canal must be more or less a nuisance to that place?—Yes.

15,691. Has the attention of the commissioners

PONTEFRACT.

Mr. T. Wordsworth.

30 Nov. 1866.

been directed to the advisability of carrying the sewage on to land instead of into the canal?—I believe that the water is tolerably clear after it leaves the tank; the refuse remains in the place, which is cleaned out occasionally when required.

15,692. Is there any land in the neighbourhood suitable for irrigation?—I think there might be.

15,693. Do you think the sewage might be applied to land without difficulty?—I think so.

15,694. Where do you get your water supply?—From a well in Tanshell.

15,695. Do you pump it?—Yes.

15,696. What volume of water do you pump daily?—About 50,000 gallons.

15,697. And that is distributed among a population of about 5,000?—Yes, including Tanshelf, about 6,000. Then we have another source; perhaps from 10,000 to 15,000 gallons run into the town from the old source, from a well at the opposite side of the hill.

15,698. Do you find that daily supply sufficient for domestic purposes and for cleansing waterclosets and sewers as well?—It is not quite sufficient.

15,699. What steps, if any, are the commissioners taking to improve the water supply?—They are taking none at present. Formerly the town was supplied with other water, and there were many private wells containing pretty good water too, but the town was supplied from that source alone. About 14 years ago a well was sunk and works erected; it is 13 yards deep, but the rock is about 16 yards high.

15,700. What is the quality of the water?—I do not know, chemically speaking; the water is from the limestone.

15,701. It is hard water?—It is hardish water.

15,702. Whether you discharge the sewage into the canal or into the river is not the act the same, and ought not any measure which the Legislature may pass to prevent pollution by sewage be made to apply not only to towns casting their sewage into running streams but to towns casting their sewage into any channels containing water?—Yes.

15,703. (*Chairman.*) Do you know that the water which flows from the sewage in the tanks, and which flows away bright in appearance, has still all the elements of sewage in it?—No doubt it has.

15,703*a*. And that in no respect has it been altered in its character, except that it has parted with some solid ingredients?—Yes, that I can believe.

The witness withdrew.

W. Wood, Esq.

WILLIAM WOOD, Esq. (Monkhill House, near Pontefract), examined.

15,704. (*Chairman.*) Are you resident near Pontefract?—I live just outside the municipal boundary; practically I am in Pontefract and surrounded by that township. I live near the station; Monkhill is a small township of four or five acres in the county of York, but surrounded by the township of Pontefract.

15,705. You are, I believe, acting as a county magistrate in this part of the riding?—I am, and am chairman of petty sessions at Pontefract.

15,706. At one time you were member for Pontefract?—Yes, in the Parliament elected in 1857.

15,707. Do you know anything of the main sewerage of Pontefract?—Yes, I am a native of Pontefract, and I know it pretty well; there is a main sewer only on one side of the town; the other side of the town, the north side, is not sewered at all, excepting by a branch sewer which is emptied into a stream on the north side of the town.

15,708. And the sewage pollutes that stream?—Yes, all the sewage on that, the north side of the town, is deposited in the stream where it runs over a very flat swampy district which was formerly and is now known as the mill-dam. The water is dammed up there, and in the summer time it is excessively offensive; in my opinion the state of the stream is highly dangerous; there is a most decided stench arising from it, and there are very large deposits of sewage.

15,709. Has there been any attempt made to utilize any portion of it?—Until a few years ago they had for the sewage on the north side a small receiving tank in a garden with no masonry or brickwork, and in that the sewage was caught, and some liquid overflow ran out; but two years ago this depositing tank was one away with, and the whole of the sewage was taken down to a running stream, which a few years ago was a clear stream. It runs through some ground of mine, a small park in front of my house, where the water was perfectly clear a few years ago, and last year I received notice from the Mayor of Pontefract, as chairman of the sanitary committee, to clean out this running stream. He called it an offensive drain, but it had become so chiefly by the act of the local authorities, the street commissioners.

15,710. Then they first committed an injury to the stream, and then they added insult to it by asking you to clean the drain out?—Yes. I wrote to the mayor and stated that one portion of the governing body of Pontefract had committed a great offence towards me, and a great nuisance, and then another portion of the governing body called upon me to remedy it. I requested the Mayor to put a stop to this, but I have received no reply to my letter. I called upon him to stop this matter as chairman of the sanitary committee. I believe that the sanitary committee have a right to bring the street commissioners before the magistrates, who have power to deal with them.

15,711. This is a small stream, is it not, arising from springs chiefly?—Yes, partly from springs in that neighbourhood, and there is a stream also from Tanshelf valley. Then the Lancashire and Yorkshire Railway Company made a cutting between Pontefract and Wakefield, and much spring water comes down from that; it is a very fine, nice stream of water, but, as I have said, it has been ruined chiefly by the street commissioners of Pontefract who have charge of the sewerage.

15,712. If they would do their duty, and properly sewer Pontefract, and deal with the sewage in a sensible manner, that stream might be restored to its original purity?—Yes; it is of itself very pure water.

15,713. If they would do as has been done in other places, in cases which I could cite, that which is now a polluted stream by their own act would be restored to the state in which it was at first, a pure pellucid stream?—Yes; it would not be six hours before it was a pure stream, if the sewage was kept out. There are no sewerage works on the north side except the branch sewer which is taken directly into the running water of the stream by the authorities of the town.

15,714. Is there a considerable fall in this stream as it enters your property?—Yes, there is a very good fall just before it enters my property, it falls from the bridge; there was formerly a small mill there; it is called the mill-dam, but the great deposit is just above my property, which I consider to be highly dangerous, because it covers a large flat, and gives off deleterious exhalations.

15,715. Is your property purely ornamental?—Entirely so; there is a small grass park in front of my house.

15,716. It is perhaps not a place where you would like any experiment to be tried in applying sewage to grass land?—The levels would permit of it, but I cannot say I should like it in front of my house; part of it is immediately in front of my house.

15,717. Although the application of the sewage might produce very heavy crops of rye grass, yet you apprehend that it would be a nuisance to you?—I fear so, and besides that part of the place is close to the houses of the poorer part of the population who live in the old part of the town. There have been many cases of fever there, which I believe have been produced by this deposit of sewage.

15,718. For what distance does the stream traverse your ground?—It goes across my grounds for about 800 feet.

15,719. Then you would not, I suppose, approve of a conduit to take away the sewage past you out of the brook, as it would at the same time take a certain amount of the brook water, and perhaps dry the brook up?—I should not like such a conduit.

15,720. You want to have the brook in its original purity?—Yes; I keep cattle on the land, and I do not know how they are to drink out of the offensive drain, as it has been termed; before the pollution it was good water.

15,721. When did the authorities of the town first begin to make this drain so offensive?—Some small part of the liquid sewage has been, I believe, for a long time turned into the stream, but, as I have stated, up to about two years ago they had a depositing tank in a garden, and the sewage was got out for manure; the overflow then ran down to the water, but the result was not nearly so bad as now; two years ago they did away with the depositing tank and made a culvert, and that passed the sewage directly into the stream.

15,722. I suppose you are aware that you have a remedy against the commissioners?—Yes; but I do not wish to act unneighbourly. I was in hopes that the evil would be remedied, and I wrote to the mayor to that effect, but I fear they will not do it unless they are compelled.

15,723. If in consequence of the report made by this Commission Parliament should think fit to pass any measure for a general conservancy of the streams of the country you would then be protected under a general law, and you would prefer that to being compelled to take proceedings against your own townsmen?—Yes, I should very much prefer it. In the other case I should have to prosecute the street commissioners collectively and individually, as what I have complained of is not only done by them as a body, but it is also done by individual members of the body; the example being set, some of them turn the contents of their own private drains into the stream; they have recently begun to do that.

15,724. You would have to engage in a personal contest with your neighbours, and to fight a body who would put their hands into the public pocket for money to meet the expenses, while you would have to meet them out of your own pocket?—Yes.

15,725. You have made this statement not with the view of casting personal censure upon any persons, but to show that a public evil exists, by which private damage has been inflicted upon you?—Yes, very great injury.

15,726. Although the corporation are not the offenders, yet they turn round upon you and ask you to remedy the mischief which the commissioners have done to you?—Yes. I have an order here, which is signed by the mayor, calling upon me to clean out the stream which has been fouled by what others have deposited in it, and which passes through my grounds.

15,727. Is the land on both sides of this stream your own?—Partly so; in the other part the stream is the boundary of my property.

15,728. Is the bed of the stream claimed jointly by the owner of the adjoining property?—I have claimed it, and I have occasionally cleansed the stream out. I bought it from the Earl of Harewood.

15,729. Is there a fence on the opposite side to you?—Yes; but there is no fence on my side by the stream.

15,730. Do you claim a right to the soil in the stream?—Yes, a right to the water and a right to the soil. I would suggest that in any provision that may be made by Parliament there should be a body constituted independent of the local authorities to enforce the removal of nuisances, for I am sure if it is left to them you will not get the work done. I may add that the sewage of the south side of the town is not deposited in the canal directly; it is put into the stream a mile or a mile and a half from the canal, and then the stream flows down and joins the canal at Ferrybridge, and so the sewage deposits in the canal.

15,731. The sewage has passed through certain streams, and these ultimately find their way into the canal?—Yes. I think that Mr. Wordsworth stated that below these tanks there is no offensive matter, but if you go to Knottingley and walk along the side of the turnpike road after the sewage has left the tanks you will find that there are very large deposits, and that the stream is very offensive indeed.

15,732. (*Mr. Harrison.*) Your evidence goes to show that in any Government measure it will not be merely large streams, such as the Aire and Calder, that must be dealt with but the tributaries, even such small ones as those which come to Pontefract?—Yes, of course they are the source and origin of the main streams, and if you do not deal with the small streams, and there are a number of them, you will have an aggregate of great evils in the main streams.

15,733. In a town like Pontefract, situated not immediately on the banks of a river, but on small becks, where the sewage from the town is turned into these small becks, there is a considerably greater nuisance than would be the case if the sewage were immediately sent into the Aire, where a large volume of water was passing?—I think the nuisance is very much greater, and there is no doubt that you must deal with the small streams as well as the large ones.

15,734. Have you considered at all what arrangements should be made for the management of rivers and keeping them in a pure state?—I have read the report of the commissioners, and a question has arisen in my mind, and I confess it is rather a difficult one, as to the appointment of inspectors; for instance, under any arrangement that might be made I scarcely know to whom you could delegate the appointment. I have long acted as a magistrate in the West Riding, and I have observed that when there has been an appointment to be made by the magistrates, and especially if there was a very good salary attached to it, it did not follow that the fittest man was appointed, but it was he who could raise the largest amount of county influence.

15,735. To whom would you delegate the power of appointing inspectors?—That is a difficult question to answer; partly, perhaps, to the county magistrates, and partly, perhaps, to the Government, but I would prefer the Government as a whole.

15,736. You think there should be government inspectors, similar to inspectors of prisons and factories?—Yes, I think it is absolutely necessary to have some power and authority independent of and above the local authorities.

15,737. Do you think it would answer to have inspectors appointed by the local magistrates, and to impose on those inspectors the duty to examine and report and give information as to offenders?—I should doubt it if the inspectors were appointed by the local magistrates, or any local authorities at all. I have no faith in local authorities for such purpose. I do not think that you would have the law regularly carried out unless the authority was exercised by some central organised body.

15,738. (*Chairman.*) The Secretary of State for the Home Department appoints the magistrates, does he not?—The lord lieutenant of the county first recommends, and then the recommendation is ratified by the Lord Chancellor. I am speaking now of county magistrates. The recommendations for borough magistrates are I believe ratified by the Secretary of State for the Home Department, but the magistrates are appointed by the Lord Chancellor frequently from political party motives.

15,739. Are the county constabulary subsidized by the Government, or are they paid entirely out of the county rates?—They are paid entirely out of the county rates, excepting that a certain portion—I think a fourth in some cases—is allowed by the Government out of the consolidated fund.

PONTEFRACT.

W. Wood, Esq.

30 Nov. 1866.

15,740. Has any government official anything to do with the appointment or removal of the chief superintendent of police?—No; that is entirely in the hands of the county magistrates. The chief constable is appointed by the magistrates of the riding.

15,741. Would it be an advantage if the Government had the appointment of the chief constable?—I do not think it would be a disadvantage. The county magistrates would not like it, but I think it would be no worse, perhaps better, for the public interests.

15,742. In the event of any legislation taking place to prevent pollution of rivers, and an elective representative body being constituted, with power to levy rates and find funds for carrying out necessary works, do you think it would be right that the Government should nominate a surveyor to see the law properly carried out?—I think so.

15,743. Do you think that would prevent local jobbery?—Yes, if he had sufficient power; I think that very likely there would otherwise be local jobbery. Moreover, in dealing with these matters, I see sometimes that candidates for the office of councillor make great professions. They are all for economy, and are opposed to all plans that would involve expense.

15,744. You think that if any beneficial legislation is to be carried out to prevent pollution of rivers it will not do for the Government to hand over the whole machinery to persons resident in the district, and who might be supposed in some instances to be interested in the very pollutions which it was desired to prevent?—I think that any such measure would not produce a good effect at all, and would not realize what you are aiming at, if the execution of it was left to the local authorities, and there are two reasons why; first, the object of the local authorities would be to keep down the rates, and then individual members of boards are often interested in having outlets to the stream.

15,745 Have you adopted here the machinery of the Highways Act?—No, we have not.

15,746. I believe that has been very generally resisted throughout Yorkshire?—Yes, there has been much disinclination shown to it, but I think that is wearing out. I think that the Highways Act will be adopted eventually.

15,747. A permissive Act of that kind, however good it may be, sometimes takes a long time before it can be brought thoroughly into use?—Yes, before prejudices are worn away.

15,748. Is there not sometimes another reason that certain individual interests are necessarily affected?—Yes, people are always opposed to any change.

15,749. There are some persons who hold office, and although they can tell you with a clear conscience that there is no pecuniary advantage connected with it, yet they are very loth to give it up?—Yes, some of them are very much disinclined to give up office; not perhaps with reference to any pecuniary advantage, but because of the power and the influence attached to it.

The witness withdrew.

Mr. J. Turpin.

Mr. James Turpin examined.

15,750. (*Chairman.*) Are you manager of the waterworks?—Yes.

15,751. To whom do they belong?—To the commissioners.

15,752. How long have they been established?—I have been here for 13 years, and they were established some time before that; I do not know how long.

15,753. How much water do you supply each day to the town?—About 15,000 gallons from the works where we pump the water.

15,754. How do you pump it?—With a steam-engine.

15,755. What power is it?—Six-horse.

15,756. How many houses do you supply with water?—I cannot tell.

15,757. Do you receive rent for the water supplied?—The commissioners do.

15,758. You have nothing to do with that, but only with the pumping?—Yes.

15,759. How many hours a day do you work the pump?—About 10 hours, sometimes 10 and a half; it is not always alike, it depends upon the volume wanted.

15,760. Have you as much water as you want?—Yes.

15,761. Is it good water?—I think so.

15,762. Is it constantly on in the town?—No; sometimes in the night it is off; it is off at present.

15,763. Is the water lifted up to a tank?—Yes.

15,764. What is the tank made of?—Iron.

15,765. Where does it stand?—Upon a building.

15,766. Of what size is it?—18 feet by 16, I believe.

15,767. Who was the engineer?—Mr. Hartley.

15,768. Are there fire-plugs in the town, and have you charge of them?—Yes.

15,769. How many of them?—About 20.

15,770. Have you ever used them to extinguish fires?—Yes.

15,771. Will the water rise to any height from the mains?—Yes, in some parts it will, in others not very far.

15,772. How high will it rise with the best pressure?—I think 14 yards, perhaps more.

15,773. Of what size are the street mains?—The largest of them is 5 inches in diameter.

15,774. Have any of them been choked up by deposits?—No.

15,775. How long have they been laid down?—Since the works were erected, it may be 14 years.

15,776. Of what are the service pipes made that go into the houses, of lead or wrought-iron?—Some are lead and some are iron.

15,767. Do you put them in, or is a plumber employed?—A plumber does the work.

15,778. Do parties apply to the waterworks office before the supply is put on?—They have to apply to the person who collects the rates.

15,779. Does your water come from springs, from a well, or from a stream, or from all three?—It comes out of a well, but there are springs which flow into this well from several streams.

15,780. Has the advisability of making the works larger been discussed?—I have nothing to do with that.

15,781. Of what diameter is your pump?—We have two pumps, and they are each of them 6 inches and 3-16ths in diameter.

15,782. What stroke?—18 inches.

15,783. What number of strokes in a minute?—About 28.

15,784. Do they work well?—Yes, they work very well.

15,785. Have they never broken down?—No.

15,786. Have you more than one engine?—No.

15,787. How often is it necessary to clean out the boiler?—Once a month.

15,788. Do you find much deposit in it?—There is a little crust.

15,789. Do you ever blow out while you are working?—No.

15,790. Have you a mud-cock at the bottom of the boiler?—No.

15,791. Do you make smoke in firing?—Yes; we have no smoke burner.

15,792. Cannot you fire without making smoke?—Not very well at present as we are situated, I think.

15,793. Of what length is your boiler?—12 feet.

15,794. What is its diameter?—4 feet.

15,795. Has it internal flues?—No, they are under the bottom and round the sides.

15,796. What length is your furnace?—About 4 feet.

15,797. Have you a single set of fire-bars or a double set?—A single set, the whole length.

15,798. What length of dead plate is there inside the door?—10 inches or a foot.

15,799. If you fired on that dead plate you could get a fire up without making any smoke?—I think I could not; there is steam as well.

15,800. Did you ever try?—No.

15,801. (*Professor Way.*) I think you stated that you pumped 15,000 gallons a day?—50,000 gallons.

15,802. Could you get more if you wanted it?—Yes.

15,803. (*Chairman.*) By working the engine longer?—Yes.

15,804. You do not pump the water all away?—Not quite at present.

15,805. Did you ever pump for the whole 24 hours?—No.

15,806. If your pump broke down what should you do?—We should get it mended as soon as we could.

15,807. What would the people in the town do for water?—There would be no water, and they must go without it for a time.

15,808. (*Mr. Harrison.*) How were you off for water in 1864 and 1865?—It was scarce then.

15,809. What volume daily could you then supply to the town?—Between 30,000 and 40,000 gallons.

15,810. Instead of 50,000?—Yes.

15,811. Could you continue that through the whole season?—Yes.

15,812. (*Chairman.*) Of what depth is your well?—13 yards.

15,813. To what depth are your pumps placed down the well; where is the working barrel?—It is about eight yards from the top.

15,814. What length is the suction pipe?—About 12 or 13 feet.

15,815. Have you a lift below your rams?—No.

15,816. What is the height of the lift?—About 16 yards above the surface.

15,817. What height has the water to be raised into the tank?—16 yards.

15,818. Do you know what the lift is altogether?—From the bore of the suction pipe it will be near 30 yards.

15,819. How often do you find it necessary to change your bottom clacks?—Sometimes it will go past a year and sometimes not half a one.

15,820. Have you any difficulty in getting to them; how do you draw them?—I only have to loose the door and take the nut out and put a new one on.

15,821. What is the kind of rock that your well is sunk in?—Limestone.

15,822. (*Professor Way.*) What kind of water is that which you supply for washing purposes?—Very hard.

15,823. Does it produce much curd?—I daresay it does. We never use it for washing.

15,824. Do they not use it for washing in the town?—I do not know.

15,825. What is the water pumped into the town for?—They use soft water, I should think, when they can get it.

15,826. Do you make tea with it?—Yes.

The witness withdrew.

PONTEFRACT.

Mr. J. Turpin.

30 Nov. 1866.

Mr. William Gundill (Pontefract) examined.

Mr. W. Gundill.

15,827. (*Chairman.*) Are you manager of the gas-works in this town?—Yes.

15,828. How long have they been established?—I think about 32 years.

15,829. What quantity of gas do you make now in a year?—I think about 10,500,000 cubic feet.

15,830. Is that a greater quantity than you formerly made?—Yes.

15,831. What quantity of coal do you consume annually?—About 1,200 tons.

15,832. For gas making and all your purposes?—Yes.

15,833. Do you use iron or earthenware retorts?—They are all brick retorts but two sets.

15,834. How many have you in use?—Seven brick retorts.

15,835. How many iron ones have you in use?—Two sets of three.

15,836. Then you have 13 altogether?—Yes. The brick retort is 7 feet long and about 4 feet wide.

15,837. What is the price of coal here for making gas?—It averages about 10*s.* 6*d.* a ton; it comes from the Barnsley district.

15,838. What is the price of gas?—4*s.* 7*d.* per 1,000 cubic feet.

15,839. Is that the highest price?—Yes.

15,840. What becomes of the gas tar and the ammoniacal liquor?—The ammoniacal liquor is sold to the proprietor of some chemical works, and the gas tar is sold for asphalting.

15,841. Do you find any difficulty in getting rid of it?—No.

15,842. Have you any coke to dispose of?—Yes.

15,843. How much per ton do you get for it?—9*s.* a ton.

15,844. How much coke do you get out of a ton of coal?—I think better than half a ton of coke.

15,845. Do you ever change the water in your tanks?—No, and we have not done so for many years now.

15,846. What do you purify the gas with?—With lime.

15,847. Have you ever tried oxide of iron?—No.

15,848. Do you purify with dry lime?—It is just moistened a little.

15,849. How much lime do you use in a week?—I cannot answer that question.

15,850. Not quite a ton a week?—No.

15,851. Have you any difficulty in getting rid of it?—No; we sell it at 1*s.* 6*d.* a ton.

15,852. Do the farmers take it?—Yes.

15,853. Are applications made to you sometimes by mothers for permission to take their children into the purifying house when suffering from whooping cough and croup?—Yes, very often.

15,854. Do you make any charge for it?—No.

15,855. Does anything pass out of your gasworks as refuse which causes annoyance to anybody?—I have not seen anything of the sort.

15,856. You do not discharge any foul water, gas tar, or ammoniacal liquor?—No, it is all sold.

15,857. Do you make smoke?—We make smoke sometimes.

15,858. But not much?—No, we principally use coke.

15,859. Do you sometimes use coal?—No, it is too dear; we get a better heat out of coke.

15,860. I suppose the smoke is principally caused when you are charging the retorts?—Yes, but it is not so very much.

15,861. Do you use much water for the purpose of slacking the coke?—Yes.

15,862. Where do you get it?—We have a well of our own in the garden.

15,863. Do you use that well water for any other purpose?—No, only for the ashpans underneath.

15,864. Do you use it for tea making in your own house?—No.

15,865. Where do you get your water for tea making?—We fetch it from the town tap.

15,866. Do you use that water for washing?—No.

15,867. What water do you use for washing?—We collect soft water from the roofs of houses for that purpose; the other is too hard for washing.

15,868. Is that generally done throughout the town?—Yes, I believe so. When the other is used it curdles up, it is too hard.

15,869. (*Professor Way.*) What do you get a ton for the gas tar?—About 1*l.* 1*s.*

15,870. And how much for the ammoniacal liquor?—5*s.*

The witness withdrew.

PONTEFRACT.

Mr. B. Hartley.

30 Nov. 1866.

Mr. Bernard Hartley (Pontefract) examined.

15,871. (*Chairman.*) Are you residing near Pontefract?—Yes, in Tanshelf, the adjoining township.

15,872. Are you the nephew of Mr. Jesse Hartley, of Liverpool?—Yes.

15,873. Are you bridge-master for this riding?—Yes.

15,874. You hold your father's appointment?—I do.

15,875. Did you, sometime since, design a system of sewers for the commissioners of Pontefract?—In 1854 I designed the main sewer on the south side of the town. I was applied to only for that sewer.

15,876. What had been adopted previously to that sewer?—Open drains running down the valley.

15,877. Then that sewer was designed to collect the refuse and take it away to some point further out of the town?—It intercepted the drains running south the whole length of the town.

15,878. And it carried the sewage to an outlet?—It carried it to a point on the road to Knottingley, where it joins a brook which comes from the north of the town.

15,879. Were there depositing tanks built there?—Yes.

15,880. Was it proposed to use the sewage from those depositing tanks on the land?—Yes.

15,881. Do you know whether that has been carried out?—I believe not; it was found not worth while to do so.

15,882. What is the sectional diameter of that sewer?—There were two diameters; there were about 600 yards, with an area of 660 inches, and about 1,282 yards, with an area of 1,779 inches. The sewer was egg-shaped, with an invert bottom of 18 inches in diameter.

15,883. I assume that you did not profess to be attempting more than simply an outlet sewer?—Simply an outlet sewer.

15,884. Not a system of sewers for the place?—Not at all.

15,885. Did you put any ventilation into it?—There are man-holes.

15,886. Are they capable of being opened without the road being broken up?—I think not.

15,887. They have not moveable covers?—No.

15,888. It would cost very little to put a moveable cover in before forming the road surface?—Very little.

15,889. And in that case you might have a ventilating grate by the side of the man-hole?—Yes.

15,890. How long have you acted as surveyor to the riding?—About 10 years.

15,891. Is that since your father's death?—Yes.

15,892. I suppose that you were brought up with him previously, when he was living?—I was.

15,893. In fact you have acted either as assistant or as surveyor since you have been in business?—Yes.

15,894. You would consider yourself as having been articled to your father, or brought up with him?—Yes.

15,895. Were you for any portion of your time with your uncle?—Yes, for three or four years.

15,896. At Liverpool?—Yes.

15,897. As Riding surveyor, have you had to take notice of any nuisances caused to rivers and streams by pollutions of any kind?—It forms no part of my duty to take notice of such things.

15,898. Your duty consists in repairing highways and bridges?—Yes, and the road attached to the bridges 100 yards on either side of each bridge.

15,899. Have you any records of the rainfall of the district which have been kept for any length of time by yourself or your father?—Not by myself. I have no such record.

15,900. Have you any record of the height to which floods have reached in former periods?—In certain cases I have records of that kind.

15,901. In your recollection have you had any of your bridges damaged or washed away by floods?—Not by natural floods. The case of the bursting of the reservoir at Sheffield, and the Holmfirth case, are exceptions.

15,902. Those came within your district?—Yes. Until the last flood I have had no bridge washed away; in the last flood I had a wooden bridge washed away, by Sowerby bridge. The last flood was higher than any I have known. The bridge was only built by me five years ago, and it was higher than the then flood water, but the last flood was three feet above it.

15,903. Where is that bridge situated?—Over the Calder, about three miles from Sowerby bridge.

15,904. Was it entirely carried away in the last flood?—Yes, it was slewed round on to the bank and floated off the piers.

15,905. Were the piers taken round?—No.

15,906. What height vertically did that flood rise from the summer level up to its flood level?—About 13 feet I think on this occasion; it was higher than any former flood of which I have had evidence.

15,907. Have you made yourself acquainted with the amount of rainfall in your district so as to gauge that particular flood?—No.

15,908. We were sitting at Halifax at the time of that flood, and the evidence given to us was that there fell 4½ inches in 48 hours, namely 2¼ inches each 24 hours. Have you noticed the character of the streams during the time that you have had to do with the bridges, as to whether they are to the eye more polluted than when you first knew them?—They certainly are much more so.

15,909. They are getting darker coloured?—They are much more offensive in every respect.

15,910. Do you consider them offensive to yourself when on them or near them?—Frequently they are; at Swillington bridge, and below Leeds, the stream is very offensive.

15,911. When you have had interviews with the magistrates with respect to your own business have they made remarks about the pollutions?—On one or two occasions I have had my attention called to the outlets of sewers, but I have no legal power to interfere with them.

15,912. Supposing that in any conservancy of the streams jurisdiction to prevent pollution in your district was vested in yourself, and that you had proper means given to you, do you think that it is a duty which you could take upon yourself and carry out?—I could not undertake it, it would be so extensive that no one man in the West Riding could undertake it.

15,913. I am assuming it to be put under the same department and a proper staff to be provided?—I do not think that I could undertake it.

15,914. Are you in private practice?—I am not; I devote my whole time to the Riding.

15,915. It is an extensive Riding?—It is.

15,916. What number of bridges have you under your charge?—325. I have also all the public buildings and asylums.

15,917. Are you at liberty to be consulted if any person wishes to consult you; would you consider yourself at liberty to act as consulting engineer?—That is rather a difficult question. I should not refuse to act simply as consulting engineer; I should not carry out any work.

15,918. Have you any restriction put upon you by your appointment?—I have as to carrying out any other work. I should not undertake that.

15,919. At what points of your district are the rivers, in your estimation, most polluted?—I think that the Aire is the most polluted of all the streams, beginning perhaps at Kirkstall, and going down to its outlet.

15,920. I suppose that you have jurisdiction over the tributaries running down to the main streams?—I have bridges over the tributaries.

15,921. Have you many fords in the Riding?—Yes, a great many.

15,922. Where there are no bridges at all?—Yes.

15,923. During flood periods is difficulty expe-

rienced in crossing at those points?—I presume so; I have nothing to do with the fords.

15,924. You do not take charge of the stepping stones, or of the temporary means of getting across?—No.

15,925. Nor of the approaches?—No.

15,926. Have the magistrates authority to put bridges wherever they think proper; could they bridge over those fords?—I think that that is more a question for the solicitor of the riding than for myself.

15,927. Since your appointment have you built any new bridges where there were no bridges before?—I have not.

15,928. (*Mr. Harrison.*) Do you know the part of the river Aire above Keighley, where the improvements have been carried out by the commissioners?—I do.

15,929. Have you observed the effect of the improvements?—I have.

15,930. Should you consider that they have been beneficial, or otherwise?—They have been very beneficial I think.

5,931. What has been the effect on the bed of the river where any of your country bridges cross the river?—At Stockbridge, which is just below Keighley, the effect has been to lower the surface of the stream considerably. I should imagine that the bed is not interfered with.

15,932. I assume that as county surveyor your attention is drawn to the condition of the bed of the river where your bridges are?—Yes, in the neighbourhood of the bridges.

15,933. Have you observed whether in any places the bed of the river has been raised?—In many places it has been raised very much.

15,934. Is not that liable to cause extra flooding of the river and to endanger your bridges?—No doubt to an extent it does endanger the bridges, and causes back water in time of floods.

15,935. Have you, as county surveyor, or have the magistrates any power to prevent that accumulation, or to take steps for remedying it?—I exercise a supervision over the stream for 50 yards on either side of any bridge, beyond that I have no control.

15,936. In cases where you have observed that the bed of the river has risen adjoining a bridge, to the danger of the bridge, have you taken any steps to have the bed of the river deepened?—In the case of some small bridges I have had to have the whole watercourse frequently cleared out, but, as a rule, I have no power beyond 50 yards on either side of the bridge.

15,937. You have power to deepen the bed yourself, but you have no power to call upon anyone else to do it?—Just so.

15,938. (*Chairman.*) If a turnpike road crosses one of your bridges, do you maintain it 50 yards on each side?—As a rule I maintain 100 yards on each side of any bridge.

15,939. And the bridge itself?—Yes, and the structure of the bridge.

15,940. You do not pass that duty into any other hands?—No.

15,941. It may be a turnpike road?—It may be.

15,942. But you do not let the turnpike road trustees have authority over the surface?—No; I repair in each case. There are many exceptions to the rule of 100 yards; many of the bridges are supposed to end with the end of the battlement; that is from custom, from long usage.

15,943. Have you jurisdiction over any of the bridges in Leeds?—Over the Leeds bridge.

15,944. Where the flats were sunk the other day?—Yes, that bridge is under my charge.

15,945. Did the flood injure the battlement of that bridge?—I am not aware of it; I was there on the day of the flood; I have not been there since.

15,946. Are you aware that the battlement is leaning on the up side of the bridge?—It is slightly; but I do not think that that was caused by the flood.

15,947. Is it under your charge that those old flats have been removed?—No, I think that it is under the Aire and Calder Navigation Company.

15,948. But if that bridge had been swept down I assume that the county would have had to rebuild it?—No doubt.

15,949. When wharf walls, or quay walls of any sort, or graving docks, or yards are put up upon the banks of the river, have plans to be deposited with the magistrates, and do they come before you?—Only in cases where such constructions come within the limit of the jurisdiction which I exercise over the stream, viz., 50 yards. I only see that they do not narrow the stream above or below the bridge.

15,950. Do you know the tributary becks which come down through Leeds into the main river?—No. I have no bridges over them.

15,951. They are not under your charge?—They are not.

15,952. Then you have not seen that there are many archways and some buildings put over those streams?—I know that there are such things.

15,953. And that during the last flood the water was over them, in some cases 4 feet, and in some cases 6 feet?—I have no doubt of it.

15,954. They must be very great obstructions to the down coming of the water?—Yes.

15,955. If any person in Leeds, or anywhere upon the river, wishes to build a wharf wall for commercial purposes must he necessarily consult the magistrates, and would the plans come before you?—Not necessarily; I can only interfere in case I find that he is contracting the width of the stream above or below the bridge.

15,956. The jurisdiction of the Aire and Calder Navigation Company is exercised under their own local Acts independently of the magistrates?—Yes.

15,957. And their dredging operations are carried on independently?—Quite so.

15,958. You know and necessarily come into contact with Mr. Bartholomew, the engineer to the Aire and Calder Navigation?—Very rarely. The only occasion on which I have to speak to him is to get him to draw the water off at some of the bridges when I have to repair them.

15,959. Do you superintend any dredging as county surveyor?—No.

15,960. Only the refuse in the smaller streams if they are choked up near a bridge?—Yes, that is all.

15,961. Do you think that the beds of the tributary streams are being raised above their former level by any action which is going on?—I have no doubt that in many cases they are by ashes and refuse thrown in.

15,962. The last flood has done more damage to property bordering on the river than any flood which you recollect?—Yes, much more damage.

15,963. I suppose that one reason would be because there is very much more property to be damaged?—That no doubt would be one reason; the flood also has been much more extensive.

15,964. Are you aware that there is a flood-mark in Leeds, not very far from the Leeds bridge, which is either two or three feet higher than the last flood, and that that flood occurred in 1773?—I was not aware of that.

15,965. When we began taking evidence for the first week or two every witness declared that the floods were less now than they had been formerly, and that land drainage had done it all, and that we should never see such floods as we had had in former times?—I should think that the effect of drainage was the contrary.

15,966. (*Mr. Harrison.*) Have you any county bridges below Ferry bridge?—No, Ferry bridge is the lowest.

15,967. Then you do not know the effect of the flood in the lower part of the Aire?—I do not.

The witness withdrew.

PONTEFRACT.

Mr. R. Heptinstall.

30 Nov. 1866.

Mr. Richard Heptinstall (Castleford) examined.

15,968. (*Chairman.*) Where do you reside?—My residence is in Allerton-Bywater; it is on the north bank of the rivers Aire and Calder, just below their confluence; they join about a quarter of a mile above my residence.

15,969. What business do you carry on?—I am a corn miller and a maltster.

15,970. Where are your mills situated?—In the parish of Castleford, on the south bank of the river, near the dam.

15,971. Do you use water or steam power, or both?—Both.

15,972. What amount of water power do you use?—About 30-horse power.

15,973. And what amount of steam power?—About 10-horse power.

15,974. What weight of coal do you burn per annum?—We do not use steam power regularly, only occasionally; we attach it to one of the waterwheels when we have high water or slack water. When we use it we consume about 16 or 18 cwt. of coals per day.

15,975. What do you do with your ashes?—We put them on the roads.

15,976. You do not put them into the river?—Not any.

15,977. Are your mills situated within the town of Castleford?—Yes.

15,978. Is there a local board in Castleford?—Yes.

15,979. What is the population of Castleford?—I should think about 6,000.

15,980. What is its rateable value?—I do not know exactly; I should think about 8,000*l.*

15,981. Are you chairman of the local board?—Yes.

15,982. How long have you been chairman?—About four years.

15,983. When did you adopt the Local Government Act?—In 1849 or 1850.

15,984. You adopted the Public Health Act?—Yes, and after that we adopted the Local Government Act.

15,985. Have you carried out any system of sewerage?—Yes.

15,986. Where do your sewers empty themselves?—Into the rivers Aire and Calder.

15,987. Have there been any complaints from any persons as to your emptying the sewers there?—I think not, at least very little.

15,988. Are there many waterclosets in the town?—Not many.

15,989. Are the houses generally drained and connected with the sewers?—Yes.

15,990. Have you many private slaughter-houses in the town?—Yes, a good many. We have no public slaughter-houses.

15,991. Do they drain into the sewers?—Yes.

15,992. Of what age is your water-wheel; how long has it been situated where it is?—I do not know. I should say a very long time.

15,993. Have you only one wheel?—We have two wheels.

15,994. Are they undershot or breast wheels, or overshot?—They are both undershot.

15,995. Of what diameter are they?—One is about 20 feet and the other about 17 or 18 feet.

15,996. There is a weir in the river opposite the place where your mill is?—Yes.

15,997. Is your power as good now as when you first knew it?—No, the deals have been lowered about 13 or 14 inches by the Aire and Calder Navigation Company, and consequently the head has been lessened.

15,998. Do they dredge the river below you?—Yes, at a considerable distance below us, but they dredge a great deal above us.

15,999. Is your tail water as free to run away now as when you first knew it?—I think not quite.

16,000. How long have you been acquainted with the river at that point and at that mill?—I am about 47 years of age, and I was born at Castleford. I was away from Castleford from 1840 to 1850.

16,001. Did the last flood do you any injury?—It did us a good deal of damage.

16,002. In what way?—It did us damage in flour and bran, bean meal, and wheat.

16,003. If you had had these extra deal boards on the dam would not the damage have been greater?—They always knock down those boards when the water get to a certain height, so that they would not have made any difference. They used to be nearly three feet, and now they have cut them down to nearly 12 inches. These boards only apply to dry weather seasons.

16,004. Have you noticed whether your dry weather flow is more or less than it used to be; are you shorter of water now than you were in former times?—The years 1864 and 1865 were the driest seasons that I ever knew. I never recollect being so short of water as during those seasons.

16,005. Has the last flood been as heavy as any which you remember?—It has been about two feet higher than any flood which I ever remember before.

16,006. Was it as high as any flood that you have any record of; does any person remember a higher flood?—I think that no person in our neighbourhood recollects so high a flood as the last one.

16,007. How long did it last?—The extreme flood was for about an hour on Saturday the 17th of November, from 11 o'clock in the forenoon to 12. That was the highest point.

16,008. Looking at that flood, and seeing the effects of it, I suppose you would say that whatever the opinions may have been with regard to the diminution of floods the last flood is an answer showing that they have not diminshed?—Exactly so. I certainly had formed the opinion that we should not have such high floods again as we had had, because we have not had them for several years, and the reason why we had a good deal of flour and grain damaged by the last flood was because we fancied it safe, as the place where it was had been out of the way of the highest previous flood, but this flood got up nearly two feet higher, and did us damage.

16,009. How is the condition of the water of the river now as compared with what you once knew it?—Formerly we lived in the township of Castleford, and near to the south bank of the river, and we used the water regularly for general purposes, and we considered it very good indeed up to 1850. Then we removed to the north bank of the river.

16,010. What were the general purposes for which you used it?—For making tea, and washing and brewing, and all sorts of things.

16,011. For your domestic purposes?—Yes, we had no other water at the place where we resided.

16,012. What is its condition now?—It has been very impure lately.

16,013. Is it offensive upon your mill wheel?—In 1864 the water was exceedingly offensive. I myself had diarrhœa very badly, and was laid up for some time. My wife and family also had it, and the millers in my employment were laid up with low fever and diarrhœa. One man was laid up for 10 weeks, and I had only a sufficient number of men to work one part of the mill for two or three weeks.

16,014. And you think that that was partly attributable to the impure state of the water and the effluvium arising from it?—Yes.

16,015. Has it any injurious effect upon the flour?—I do not know; I cannot say that it has.

16,016. How many horse-power do you consider that your water-wheels are?—About 30.

16,017. What does it take to drive a pair of stones?—It depends upon the quantity which you grind; as a rule we grind about three bushels an hour, and it takes three-horse power for one pair of stones.

16,018. And then you have dressing and cleaning machines?—Yes.

16,019. What does it take to drive those?—I should think that it would take two or three horse power

for each dressing apparatus in each mill. We have two mills, and all the machinery for each mill is separate.

16,020. Then you calculate that you have 30-horse water power?—About 30-horse.

16,021. Is the mill your own, or do you rent it?—It belongs to the Aire and Calder Navigation Company; I rent it.

16,022. What do you value a one-horse power at? What is its nominal value, irrespective of local conditions?—I am sure that I do not know exactly.

16,023. It is mixed up with other things?—Yes.

16,024. Would you prefer water power or steam power?—It depends very much; steam power is more certain, and water power is generally a little cheaper.

16,025. Did the last flood stop your wheel?—Yes; we were in backwater on the Friday morning, and we did not start one of our mills until Thursday noon in the next week. The other we started on Wednesday morning.

16,026. Did the flood do any injury to your machinery?—I think not, except that it warped the pit-wheel nearly up to the axle, and we had to take the warp out with buckets, and throw it into the river again.

16,027. Have your buckets iron shrouding?—No, they are wood. One of the wheels is shielded, that is to say, it has iron at the side, but the other is open at the side.

16,028. And there are simply flat boards projecting from the circumference of the wheel?—No, they are not exactly flat; each board bends a little.

16,029. How long have the wheels been down?—The water-wheels were before my day. They have been improved a good deal. Two or three years ago we put shields to one of them and new boards, which we considered improved it very much. One of the wheels is of new construction, and the bend at the bottom lifts out of the water rather easier.

16,030. Are you at all plagued by solid matter flowing down in the surface of the river and blocking the gratings?—Yes, and sometimes we are obliged to stop in order to get it out.

16,031. Are you at all troubled by the carcases of animals coming down?—Yes.

16,032. What are those carcases?—Dogs and cats, and almost all sorts of things.

16,033. Do you take them out of the water or sludge them past?—We send them over the weir or dam and let them go to some one else.

16,034. You do not take them out to bury them?—No, we have no ground to bury them in.

16,035. Do you get much of that class of refuse?—Yes, a good deal.

16,036. It is a nuisance to you?—Yes.

16,037. In hot weather those carcases are very foul?—Yes.

16,038. And they stink very bad?—Yes.

16,039. Would you be sorry if it was the duty of some person to take out those carcases and bury them before they came to you?—I think that that would be a very great improvement, and I should be very glad if it was done.

16,040. Have you much solid pollution coming down upon you in the shape of ashes, or have you had much formerly?—It is not ashes exactly which comes upon us; it is more of a warpy sort of substance.

16,041. Have you any written remarks which you would wish to offer to the Commission?—The water in the river was very clear and good excepting in flood times. That was the case 20 or 30 years ago, and we used nothing else for drinking purposes until about 1850. Up to that time there was a good quantity of fish in the river. I have frequently caught fish myself.

16,042. What fish?—Chub, roach, dace, and gudgeons, and such like.

16,043. And eels?—I never caught any eels, but I have known my brother catch a good many eels there. He had a leap.

16,044. Had you any salmon?—Yes, I generally saw salmon leap up at the dam in October and November up to 1850, and I have never seen them since.

16,045. Have you had the Salmon Fishery Commissioners here?—No.

16,046. Will you proceed with your statement?—Down below the dam it is very shallow water, and it used to be a noted place for fly-fishing, and I have seen large quantities of fish near to the bridge. You could see them from the bridge. Since that time the water has gradually become more impure, the flood waters have been darker in colour, and the sediment left on the bank has been more in quantity and the stench more offensive. In 1865, during the summer, in looking at the water you could see that it boiled up. A lump of stuff came up and relieved the water, and away it went down the river. The stench was so bad that when the wind came from a certain quarter a passer-by would almost be made to vomit. I carried a little camphor in my pocket, and generally applied it to my nose. During that time we burnt a little pitch when the stench came from the river into the mill. In 1865 the part of the water-wheel which runs into the river got coated with a white substance, almost as if you had painted it over, and when you touched it it was quite soapy and greasy, and it washed off again. That was in September and October 1865.

16,047. Then you have come to the conclusion that the river is worse than it was when you first knew it as regards quality of water?—There is no comparison.

16,048. Do you think that its condition will grow better or worse as things go on?—I am afraid that it will grow worse.

16,049. Except something is done to prevent it?—Yes. It used to be a very nice walk to walk along the towing-path at Castleford, but in the last two or three summers it has been almost impassable. There has been a church lately built where I live, and I sometimes go to church in the evening, and I walk along the river bank, and I know that in summer my wife and family were obliged to go into the field and to keep a good way off, as the stench from the river was so bad.

16,050. Have your men complained to you about the state of the water in dry weather?—Very often.

16,051. And you say that they have been seriously unwell?—They have.

16,052. And you think that it was in consequence of emanations from the water at those periods?—I think that it was. It appeared to me that the men who worked on the lower part of the floor were affected with it, but not those who worked on the upper parts.

16,053. Do you work night and day?—We generally work a day and a half, namely, from 6 in the morning till 11 at night; occasionally we should work all night.

16,054. Is there any difficulty in driving your machinery? Does it like a little idleness the same as human beings?—No doubt millstones grind a good deal better when they have stood two or three hours during the night; they go on cooler in the morning.

16,055. Have you recently introduced any improvements in grinding to cool your stones or to carry air in?—Yes, we have what they call an exhaust, which makes the stones grind cooler, and then it is much pleasanter to work and to be in the mill. Scarcely any dust comes down on the under floor.

16,056. Do you use French burrs?—Yes, for grinding wheat.

16,057. What kind of stones have you?—What we call millstone, grit stones.

16,058. (*Mr. Harrison.*) You are chairman of the local board?—Yes.

16,059. I presume that the sewer from the town discharges below your mill?—One part of it. Castleford rises westward; the water on the east side runs into the river considerably above the dam, nearly at the outside of the boundary, but the water on the other side runs below the dam.

PONTEFRACT.

Mr. R. Heptinstall.

30 Nov. 1866.

16,060. How far does it discharge into the river above your mill?—Perhaps 400 or 500 yards.

16,061. Is the black substance which you mentioned as rising to the surface above the mill or below it?—It is above the mill.

16,062. Then that may be the sediment from the sewage of Castleford, and not from that of Pontefract, or Leeds, or other towns?—Only a very small portion of Castleford sewage enters the river above the dam, the principal part enters below the dam, and therefore I should say that the pollution must come from elsewhere.

16,063. What is the water supply to Castleford?—Private wells; formerly they used the river water, but they do not use much now.

16,064. You have not a regular water supply to the town?—No.

16,065. Is the water well supplied from that source?—I think not; you have only to sink a few yards to get water. By the regulations of the local board there is, I think, a convenience to about every four houses.

16,065*a*. Is the water contaminated?—I have heard the medical men complain that it is contaminated.

16,066. Do the medical men attribute ill health to that cause?—Yes, in some cases.

16,067. Have the local board taken steps to prevent that?—They have taken steps to give a water supply at Castleford. A gentleman is present who will speak to that.

16,068. In what direction is that water supply to be obtained?—I drew their attention to a part of the old river which was cut off by the Aire and Calder Company, which is in the township of Methley; it is a lake of 13 acres, but they found that by filtration they could not take out the taste, nor make it so good in colour as it ought to be.

16,069. That water comes from the Calder itself?—Yes.

16,070. Failing that source of water supply, in what direction have you to turn?—Up to Glass-Houghton, a township in the parish of Castleford, where there have formerly been some coal mines, and a quantity of water now runs out into Castleford. We have had the water analysed, and found it exceedingly hard and scarcely fit for domestic purposes, although it is very bright to look at. It has been analysed by an eminent chemist in Liverpool; Dr. Simpson has had it analysed, he being our local officer. I believe that the Liverpool chemist thinks it more fit for medical purposes than for domestic purposes.

16,071. If the Aire and Calder were in a proper condition, and not polluted as they are, the town of Castleford would in all probability have recourse to them for their water supply?—No doubt they would.

16,072. That water is the softest which can be procured, and from your experience as chairman of the local board there is no soft water to be obtained in a neighbourhood like that?—I believe not.

16,073. Are there many waterclosets in Castleford?—I think not many.

16,074. Almost all the conveniences are privies and ashpits?—Yes.

16,075. Have you had ill health attributed to the privies and ashpits at all, apart from the mischief they do to wells?—I have sometimes had my attention called to them by the medical man; he has attributed ill health to the privies.

16,076. Has your local board taken any steps to have them removed?—No, except when they are near the water supply.

16,077. Do you take any steps to have them cleaned out?—Yes; we have an inspector of nuisances, who pays particular attention to them, and I think that he generally takes care that they are in a proper state.

16,078. The local board does not remove the contents?—No.

16,079. Are the contents generally taken out into the country and applied to agricultural purposes?—Yes.

16,080. The boards which you state to be upon the dam are removed or altered as the Aire and Calder Company wish?—Yes; they work in a joint; they consist of a number of long boards about a foot in breadth, and the Aire and Calder Navigation Company turn a crane which pulls out the pipes so as to let the water flow down; they have a certain mark by which their man knows where to draw the deals down.

16,081. It is their own mill, and therefore they have a right to do what they like with the boards?—Yes.

16,082. It is their own mill and their own weir?—Yes.

16,083. In ordinary floods does the water pass over the adjoining banks and flood the land much near your mill?—Not much. I live in rather an awkward place, and this time the water has run over the banks and into the house. During the Saturday I was locked up in the bedroom I noticed the water very particularly; it came right over the fields and the garden and flooded the house, and flooded all the lands on both sides.

16,084. Do you think that much water escapes from the Aire and Calder in that way?—In a flood like this a good deal would go over the banks; the water floods the land on both sides of the river considerably.

16,085. What is the length of the weir across the river?—It is 50 yards long, and I should think about 20 yards in breadth.

16,086. What height does the water rise above it in an ordinary flood?—In the last flood there was very little difference between the level of the water on the top side and the level of the water on the low side of the dam, and as the fall at low water is about seven feet, the water must have risen about eight feet on the top side and 16 feet on the low side; there might have been a foot fall from the top side to the lower side, but I saw them run over it with boats.

16,087. The weir was completely thrown out of operation?—It was.

16,088. How many days in the course of a year are you impeded in consequence of floods?—It depends very much upon the rainfall. Sometimes we are very much impeded and sometimes not so much. I cannot tell how many days we are stopped; it depends upon the seasons; sometimes we have run for nearly the whole winter and have been scarcely at all in backwater, and sometimes we have been in backwater for nearly three weeks together, or perhaps have had a day or two in each week.

16,089. In some cases you have been backwatered with much less flood for a longer period than you were a fortnight ago?—Yes.

16,090. A continuous rain and a continuous flood is more injurious to you, so far as water power goes, than an excessive flood such as happened the other day?—Yes, it passed off in a reasonable time.

16,091. Have you ever considered the advisability of having your water-wheels so that you could raise them in case of a flood, and take advantage of it?—I do not think that it would be practicable; if you raise the wheels you must raise the lower part as well, or the water would go right through.

16,092. In consequence of the character of your water-wheel?—Yes; I do not think that it would be practicable with our wheels.

16,093. What height does an ordinary flood rise over your weir?—About 14 feet is the highest flood which I have known before the last one, and of course it varies up to that.

16,094. (*Professor Way.*) Besides grinding corn you are, I think, a maltster?—Yes, a small maltster; the maltkiln is on the north bank of the river, near my residence.

16,095. You, I suppose, use water for wetting the barley?—Yes.

16,096. Does that liquid run into the river?—Yes.

16,097. Is it offensive in any way?—It does not appear to be offensive when it runs away, and I do not think that it is particularly so.

16,098. Does it smell acid?—I cannot say; I think

that I have smelt it a little acid sometimes in hot weather, but not in cold weather. I only steep about 10 quarters every four days.

16,099. Are there any breweries near you?—Yes, there is one about a mile from us.

16,100. Is that the brewery which was spoken of this morning?—No, it is not far from the bank of the Calder; the other brewery is about five miles from us, on the bank of the Aire, or very near to the river Aire.

16,101. Do you agree with Mr. Hone that the discharge from that brewery makes the river offensive?—I have not been there.

16,102. You do not go past that district?—No.

16,103. What is the case with the brewery near you?—It is very offensive.

16,104. What is the nature of the smell from it?—It is something like the smell of sour ale—ale going bad; the smell is very bad indeed; the liquid runs down into the open sewer, and there is not very much fall, and it stands, and the stench is very bad, it is not quite like the smell from a petty; there is decomposed yeast and such like things, principally barrel washings; at all events the liquid is very offensive in this open sewer.

16,105. (*Chairman.*) Have you thought over the question of how to prevent the pollution of the river in future?—Yes.

16,106. In what form have your thoughts shaped themselves?—My opinion is that the best plan to remedy the evil would be to run the matter into tanks, and to let the water run off again into the river, or to do something to purify it.

16,107. Have you thought at all as to what the future conservancy of the river should be?—I have not.

16,108. Are you inconvenienced in your business by smoke from other premises?—We have a good many glass works in Castleford, and we should be better without smoke; I have frequently named the matter to my neighbours.

16,109. Do they tell you that they cannot burn the smoke?—I have named it to them, and they have said that the principal cause of the smoke was the manner in which the stoker fired, and that if he put on the fire more regularly it would consume a good deal of the smoke.

16,110. Do you know that there is a patent by a gentleman of the name of Semmins, by which the whole of the operations of glass making can be carried on without any smoke?—Is it by gas?

16,111. Yes.—It would improve very much the appearance and health of Castleford if we could have less smoke.

16,112. (*Mr. Harrison.*) Castleford is an improving place, is it not?—Yes.

16,113. It is increasing in population?—It has increased very much indeed since I can remember.

16,114. Between 1851 and 1861 what was the increase?—I do not know exactly; but I think that at the first census which I knew, which was in 1831, we had only 1,000, and now within the district of the Castleford Board of Health we have about 6,000; there is a good deal called Castleford which is not actually in the township of Castleford. The malt-kiln which I occupy is called Castleford; the surveyors of Inland Revenue call it Castleford; it is quite adjoining, but it is not included in the township; it is in another township.

16,115. So that if you took in all those places the increase would appear even larger than you have stated?—It would.

16,116. What is the death rate of Castleford within the limits of your local board?—I think that it is tolerably good; the death rate of last year was about 18 or 19 per 1000.

16,117. Has the health of the people improved of late years, or the contrary?—I think that the health of the people has been better in the last three or four years than it was before; I think that we have had less fever and less diarrhœa.

16,118. When was your local board established?—About 13 or 14 years ago.

16,119. Do you attribute the improvement in the health to the steps which the local board have taken?—Yes; considerable attention has been paid to lodging-houses by the inspector of nuisances and the police.

16,120. Does your experience at Castleford go to show that Castleford, being managed under a local board under which houses are built by regulation, is better off than Pontefract where people build houses just as they like?—I am sure that at Castleford they would not make the houses so healthy if it was not for some restriction. I know that in the adjacent part, namely Whitwood-Mere, they build houses without such conveniences as there are in Castleford, and our officer of health, Dr. Simpson, will tell you that Whitwood-Mere houses are much less healthy than those in Castleford.

The witness withdrew.

Mr. William Newton Wilkinson (Castleford) examined.

16,121. (*Chairman.*) You are agent to the Aire and Calder Navigation Company, resident at Castleford?—Yes, at Allerton-Bywater, adjoining Castleford.

16,122. Are you their business agent?—I am collector.

16,123. How long have you been resident there?—Ten years.

16,124. How long have you known the Aire and Calder rivers?—50 years.

16,125. In what condition are they now as compared with what they were when you first knew them?—They are certainly very much interfered with by sewage compared with what they were when I was a lad. I have been in the service of the company 32 years.

16,126. At what period of the year do you find the rivers, or the streams, the most offensive?—We found the water more particularly offensive in the year 1865, during prolonged dry warm weather.

16,127. Was it the exposure of mud which was offensive, or the water itself?—I am of opinion that the smell arose from the Leeds sewage having been turned into the rivers, and accumulated in large patches previous to a flood. We knew that a flood was coming when we saw what our workmen called "porpoises" coming. These lumps rise to the surface, and a certain amount of gaseous matter escapes from them, and then they sink again; this occurs immediately preceding a flood, and the smell occasioned is very offensive.

16,128. Have any of your men been in any way affected or injured by the bad smell of the water?—I have not known of any who have been directly so.

16,129. Have you heard any of them complain of sickness?—No.

16,130. Are you resident near?—The office and my house are directly at the point of confluence of the two rivers.

16,131. What do your duties consist of as regards the river?—I have no duties except as collector of dues, but I am annoyed by the smell from it.

16,132. Have you ever seen carcases of dead animals floating on the river in dry weather?—Daily and hourly.

16,133. Are they a cause of nuisance?—I have no question of it; I have called the attention of the company's servants repeatedly to it and asked them to remove them further down the river.

16,134. Then would not they become a nuisance to someone else below?—No question of it.

16,135. Would you not imagine that if it was the business of some persons to cleanse the river it would

PONTEFRACT.

Mr. W. N. Wilkinson.

30 Nov. 1866.

be the readiest method to take out those carcases and bury them?—It would be an onerous duty.

16,136. But if it was the duty of persons, and if they were paid for performing it, would it not be much better?—Undoubtedly.

16,137. Did you suffer any inconvenience from the recent flood?—None, excepting the flooding of the cellars of my house about six feet.

16,138. Did it injure any of the property of the company?—Very materially.

16,139. What property did it injure?—Not only the locks but all the property adjoining, I should think to the extent of 2,000*l.* or 3,000*l.*

16,140. Were some of the locks injured?—Yes, in the Upper Calder.

16,141. Were they injured by the accumulation of water or by the solids brought down?—That I cannot state.

16,142. Was it as large a flood as you have ever known since you recollect the river?—I should think that it was about 2 feet 6 inches higher than the flood which occurred about 22 years ago. I was in the service of the company at Wakefield then.

16,143. Have you knowledge of any higher flood than this last one?—None, except the one which was referred to by a previous witness in 1775; that was higher, I should think, by probably 18 inches.

16,144. Has it occurred to you that anything should be done to correct the present foul condition of the rivers if possible?—My humble judgment is that you should prevent the Leeds sewage, and all other sewage, from going into the river.

16,145. That it should not be allowed to go in as at present?—Certainly not.

16,146. Do you know anything of the dredging operations upon the river?—Yes.

16,147. Are they much larger than formerly?—Yes, we have two dredgers now, we had only one 25 years ago.

16,148. Is the tonnage of your boats larger than it was formerly?—It is larger.

16,149. Do you not think that boats of heavier tonnage would require dredging in order to get the river down to a deeper draft?—They would necessarily require it to a greater extent.

16,150. So that the dredging may be to deepen the navigation as well as to keep it clear from refuse brought down?—We profess to keep a navigation of 7 feet.

16,151. What is the deepest draft of boat which you have?—The deepest draft is 7½ feet at best water.

16,152. Then it will puzzle that boat to go along a channel of 7 feet?—Yes, but our navigation from Goole to Leeds, or from Goole to Wakefield, is 7 feet.

16,153. How can a boat of 7 feet 6 inches or 8 feet get along there?—It cannot do it. With reference to dredging, there is no question that the Leeds sewage is the great cause of the frequent necessity.

16,154. The sewage of the town of Leeds?—Yes.

16,155. It is the pollution brought down from Leeds which causes the great injury and the great inconvenience which you suffer?—There is no question of it.

16,156. You mean the floating matter which comes down does the injury?—Yes.

16,157. (*Mr. Harrison.*) Has the late flood formed banks to any great extent in different parts of the river?—It has accumulated a great quantity of mud on the edges of the river.

16,158. Since the flood have the boats experienced any difficulty in passing up and down the Calder?—Yes, the flood has accumulated a great quantity of sand opposite my house. Instead of having a 7 feet navigation I should think that the navigation is now not more than 6 feet. We shall at once have to bring our dredgers to work.

16,159. And your dredgers will have hard work for some little time until you get the depth restored?—Yes.

16,160. (*Chairman.*) You are situated at the junction of the Aire and the Calder?—I am.

16,161. Is there any difference in the water of the two rivers?—A decided difference.

16,162. Which is the better and which is the worse?—The river Aire is like a huge sewer in hot weather; comparatively speaking, the Calder is clear.

16,163. (*Mr. Harrison.*) The volume of water passing down the Calder is larger than that passing down the Aire, is it not?—Yes, just at the mouth it is.

16,164. And the population upon the Calder is probably less than that upon the Aire?—I do not know; I am not prepared to say that.

16,165. Leeds and Bradford are upon the Aire?—Yes; and Halifax, and Dewsbury, and Wakefield are upon the Calder.

16,166. (*Professor Way.*) Why do you attribute the whole of the evil to Leeds?—Because the evil of the Leeds river is more prominent than that of the other.

16,167. Are there not Bradford and several other towns?—Bradford comes into the Leeds river.

16,168. But you say that it is the Leeds sewage?—What we call the Leeds dyke embraces Bradford.

16,169. I understood you to say, and another witness previously said, that the injury had arisen since the Leeds sewage had been turned into the river Aire?—The evil has been brought more prominently before us.

16,170. May not other causes besides the discharge of that sewage have contributed to make the river bad in that case?—Possibly so, but the matter has not been so directly brought before us.

16,171. When you mention the period of the Leeds sewage being discharged as the period at which the nuisance began, the common acceptation of that would be that Leeds was the cause of it?—We never felt the inconvenience until the Leeds sewage was turned into our rivers.

16,172. Is it possible that other towns were at the same time contributing to the pollution of the river Aire?—No question of it; but when Leeds turned all their sewage into it it brought the evil to a climax, and then we felt it.

16,173. But you do not mean to say that the whole injury has been done by Leeds?—Certainly not.

16,174. Has not the river been getting foul from other sources during that time?—No doubt it has, but not to such extent as from the Leeds sewage; the Leeds sewage has been the great cause.

16,175. You know that at the present time Leeds is not half or one fourth sewered?—Possibly not.

16,176. And, therefore, if sewerage was carried out in Leeds to the fullest extent the sewage would be very much more than at present?—Possibly. My opinion is, that if it goes on for the next 10 years at the rate which it has gone on our river will not be navigable at all.

16,177. You seem to ascribe the whole obstruction to sewage. Are you aware that large quantities of solid matter are thrown in from different manufactories along the river?—Then the parties are liable under the Aire and Calder Company's Act.

16,178. Are you aware that there are also large quantities of dye water?—We have no claim upon anybody unless solid matter is thrown in.

16,179. I suppose that putting a stop to the discharge of sewage would not purify these rivers?—It would be the most desirable thing possible. I do not say that it would clear the river altogether and make our salmon came back again, but it would be a very great thing.

16,180. Have you noticed the condition of the streams progressively, irrespective of sewage?—I have not.

16,181. (*Mr. Harrison.*) Your officers could only interfere with the throwing of ashes and other refuse into the river within the limits of their jurisdiction?—Exactly so.

16,182. Bradford is not within your jurisdiction?—It is not.

16,183. And there are a great number of mills at other places in the same case. Keighley is not within your jurisdiction?—Yes.

16,184. (*Professor Way.*) But still you have been giving an opinion in the abstract, apart from your official position, as to the causes of the pollution of the river?—Just so.

16,185. And your opinion is that the river has been brought into its present state by the discharge of sewage?—I do say so.

16,186. Have you taken into account the other sources of pollution which in our opinion are very considerable?—No. I recollect that about nine months ago, when our man was dredging with his machine, I said to him, "It smells badly," and he said "Yes, sir; it is entirely from this Leeds sewage."

16,187. (*Chairman.*) Do you know that Leeds deals with probably more skins than any other place in England, and perhaps than any other place in the world?—Yes.

16,188. That it dresses and tans 3,700,000 skins per annum?—I am ignorant of that.

16,189. Refuse from tanpits and skinneries may have something to do with the pollution?—No doubt of it; but our dredger's pans are filled with a certain material which I need not explain to you gentlemen.

16,190. Waterclosets are carried out to a very small extent in Leeds as compared with the population, or as compared with London and other towns, and if the watercloset system is put into operation you will be ten times worse off than you are now?—Yes.

16,191. Have you thought it necessary that Government should step in to remedy this state of things?—Government or some other authority must step in or we shall cease to be a navigation.

16,192. What other authority should step in; the Aire and Calder Navigation Company have statutory powers to prevent solids being thrown into the river?—Yes, but offenders are so insidious that we cannot catch them.

16,193. (*Mr. Harrison.*) How are you supplied with water in the tongue of land between the Aire and the Calder?—From the hills.

16,194. I mean for your own domestic supply?—My own individual domestic supply is from pumps and from rainwater.

16,195. Is the water from the pumps useful and satisfactory for domestic purposes?—We have no reason to complain of it; it is pretty well filtered.

16,196. Is it a hard water?—Yes.

16,197. What depth is the well?—I am not prepared to say that.

16,198. Does the water in the well come from the river filtered through the rock?—That is my impression.

16,199. And that filtration you find sufficient to give you a pure water?—We have a good water for domestic purposes. For soft water purposes we have water quite different from that.

The witness withdrew.

Mr. Adam Jessop (Castleford) examined. *Mr. A. Jessop.*

16,200. (*Chairman.*) Do you practice as a surgeon in Castleford?—Not at the present time; I have done so.

16,201. How long have you been resident in Castleford?—About 37 years.

16,202. What is the population of Castleford?—About 6,000 at the present time.

16,203. Do you remember the first outbreak of cholera in 1832?—I do.

16,204. Did it prevail to any extent in Castleford?—Yes, to a great extent at that time in comparison with the population.

16,205. In what parts of the district or town did it then prevail?—Mostly in the lower parts of the town near to the water, and in the lower parts of the ill-drained districts.

16,206. In 1832 in what state was the river as compared with what it is now?—The river at that time was in a much better state than it is at the present time.

16,207. Do you remember the outbreak of cholera in 1848-49?—I do.

16,208. Was it more severe or less severe than in 1832?—It was much more severe than it was in 1832.

16,209. Was the state of the river better or worse then?—It would be a little worse than it was in the first outbreak.

16,210. What has been the health of the population since 1849 and 1850?—I think upon the whole pretty good.

16,211. Have any improvements been carried out since that last outbreak of cholera in 1849 to account for the better state of health?—Yes, drainage more especially.

16,212. Is there any public water supply?—No, nor even is there much private water supply at the present time.

16,213. Then where do the poorer population get their water?—Mostly from the river at the present time; there is no other source.

16,214. Do you mean that at this time they obtain water for domestic purposes from the river?—Yes, principally.

16,215. Although it is tainted by sewage?—Yes. A colliery in the neighbourhood has latterly been opened, which has drained our private well.

16,216. There is, I understand, a local board in Castleford?—Yes.

16,217. Do you know whether they have considered it a part of their duty to discuss this question of giving the inhabitants a proper supply of water?—I believe that the matter has been frequently discussed by them, but not yet with any beneficial effects; at all events, they have not yet come to any decision.

16,218. Did you notice the last flood which you have had?—I did.

16,219. Has it left any evil effects upon the population?—It appears to have done considerable damage, to the property near the river more especially.

16,220. Did it flood dwellings of any of the poorer people?—A great number.

16,221. And in flooding them it would of course render them damp?—Yes, and of course they would remain damp for some time.

16,222. And I suppose that, as a medical man, you would say that the injurious effects would not be visible now, but will come out hereafter?—No doubt.

16,223. The human being does not necessarily give way immediately?—Just so.

16,224. But these evil influences may show themselves in after life?—They will no doubt be felt in the course of time.

16,225. (*Mr. Harrison.*) How long is it since you ceased to practice in Castleford?—A little more than 10 years.

16,226. Then you have hardly had an opportunity from experience and practice of observing the improvement in health consequent upon the formation of the local board?—No, not from my own personal knowledge, but I believe that health has improved since then.

16,227. (*Chairman.*) Do you know anything about the sewerage of Castleford?—I do.

16,228. It is sewered?—In some parts.

16,229. Are you a member of the local board?—No.

16,230. Is there anything further which you wish to add?—I would simply say that I think that the health of Castleford might be very materially improved by an efficient water supply, and especially

PONTEFRACT.

Mr. A. Jessop.

30 Nov. 1866.

by the drains being better ventilated. They are not ventilated at all now. I think that that is a very important matter, and I was very pleased to hear the Chairman make the very firm observations which he made a short time ago as to the ventilation of drains. It is a matter which I have thought of for some time. I may further say that the rainfall on Friday the 16th of November, commencing at about 3 a.m. to half-past 5 p.m. was $3\frac{1}{10}$th inches at Castleford.

16,231. As gauged by yourself?—Yes. We had no rain previous to 3 o'clock, and none after half-past 5 o'clock on Friday. The rain did not continue 24 hours, but simply $14\frac{1}{2}$ hours.

16,232. (*Mr. Harrison.*) We have had information that it rained for 48 hours, but we gather that during those 48 hours no more rain fell than what you mention?—On the Sunday we had a little more rain, but only rather more than the tenth part of an inch.

The witness withdrew.

Mr. R. Heptinstall.

Mr. Richard Heptinstall (Castleford) further examined.

16,233. (*Chairman.*) You have carried out certain sewers in Castleford?—Yes.

16,234. Who designed your sewers?—In the first place we had a person of the name of Peter Sharrock. We employed him as surveyor, and he surveyed the district and made us a plan, and gave us the depths and so on, and the sewerage was laid according to his plan.

16,235. Have you more than one outlet?—We have two outlets.

16,236. Where do they empty themselves?—Into the rivers Aire and Calder.

16,237. Below the junction?—Yes.

16,238. Do you know at what depth the inverts of those sewers are laid as regards the dry weather flow of the river?—The bottom of the lower sewer, which empties itself in below the dam, is not much above the low water level; it is about a foot.

16,239. Then so long as it is dry weather that sewer discharges its contents down into the river?—It does.

16,240. What does it do when the river is in flood? It cannot carry the sewage down when there is a flood.

16,241. Does a flood backwater the sewer?—Yes.

16,242. The sewage flows up?—Yes, no doubt.

16,243. When the river is above the summer level the sewers are necessarily backwatered and flooded?—Although the outlet of the sewer may be covered 2 feet the water still runs out, because the sewer has a considerable fall.

16,244. The flood will backwater it so far as the flood will reach in the sewer?—Yes.

16,245. Are you aware that when sewers are in that condition any solids in the sewers coming down will, immediately upon the sewage coming into dead water, begin to deposit?—I daresay. We have one preventive in the sewer; a sort of well is made where the grates are below the sewer, so that the solid deposit remains in the well, and the water runs off again.

16,246. Of what size is that well?—About 18 inches square.

16,247. You mean the gully?—Yes.

16,248. In the rain which we have heard of that well would be filled with solids in the first five minutes?—Perhaps it might be.

16,249. And after that the solids must go away with the water?—Yes. I have no doubt that a good deal of solid matter would go into the river.

16,250. Are your sewers at all ventilated?—Not at all.

16,251. After what you have heard do you think that you will attempt to ventilate them?—I think that they ought to be ventilated.

16,252. Have you ever heard any complaints of foul smells from the sewers?—Yes, I have frequently smelt them myself, but that is generally in hot weather, and then we apply a little chloride of lime to them, which takes the smell off for a time.

16,253. But there may be plenty of cases which escape your notice where the mischief is going on?—It may be so.

16,254. Is there any protection over the mouth of your sewer to prevent the wind blowing up it?—No.

16,255. If the wind is blowing pretty strong in the direction of the mouth of the sewer, do you think that it is possible that it may blow in and blow the foul gases up into the town?—I think that it might do so.

16,256. Do you think that it might be advisable to cover the mouth of the sewer with a flap?—Yes, a sort of door.

16,257. Carrying that door to the bottom of the sewer within about six inches?—Yes.

16,258. The dry weather sewage would then flow out without inconvenience, and the wind would not be allowed to blow in so as to drive the gases up into the town?—Yes, I think that that would be an improvement.

16,259. I suppose that you have not noticed that at particular periods people complain more of the stink than at other times?—I have not noticed that particularly. I think that it would be an improvement to have a door at the bottom.

16,260. And to ventilate all the higher points?—Yes. We have a new scheme of sewerage which we are discussing; what we call the western portion of Castleford drains into an open drain in the township of Whitwood. In that open sewer the water stands a good deal and is stagnant. We have made an offer to the Whitwood people to construct a new sewer in the lower part of Castleford, and to take it out to the lower part of the town, and to allow them to put all their sewage below the dam instead of above the dam, which would give the Whitwood-Mere people a considerable fall. We promised to take the sewer to a certain point if they would take it forward. That would put their sewage water in at a lower level than they have had hitherto, and we also should put our sewage in below the town. But unfortunately they have no local board, and they have no legal means of getting money to do the work with; it is, however, under consideration with them.

16,261. The new Sanitary Act gives them the machinery and the power to raise the money?—They have applied for permission to come under the Local Government Act, but they have not sufficient population.

16,262. If they petition the Secretary of State a Commissioner will very probably be sent down, and although the population is below the requisite amount, yet, if they are willing to adopt the Act, I can answer for it that no obstruction will be thrown in their way, for the alteration was made to serve this purpose. After the Highway Act was introduced parties adopted the Local Government Act simply for the purpose of checkmating the Highway Act?—Yes; but they are now very anxious to come under the Local Government Act.

16,263. (*Mr. Harrison.*) Has your board considered the propriety of irrigating land with sewage?—No.

16,264. Is there land suitable for the purpose?—Yes, I believe so; there is land in the neighbourhood.

16,265. Upon which the sewage could easily be carried?—I think so; it would have to be raised by artificial means, it cannot run on of itself. There is some land belonging to Lord Houghton on which the sewage might go; it is not in the township of Castleford, it is just beyond the boundary.

16,266. (*Chairman.*) Did you ever see a sewage farm?—No.

16,267. Did you ever see 20 tons of grass cut from an acre at one cutting?—No.

16,268. Did you ever hear of it?—No; that seems an immense quantity from an acre at one cutting.

15,269. Twenty-five tons have been cut and sold at 1*l.* a ton, it having been grown in three weeks; that is

Italian rye grass, and from 50 to 60 tons per annum have been cut from the same land?—It seems an immense quantity. I have no doubt that sewage would be very good for agricultural purposes if properly applied.

15,270. If you begin to grow Italian rye grass you must store the field with it, and, if possible, the most profitable thing to which you can apply it is to give it to milch cows, and to turn it into milk on the same day that it is cut?—Yes, in a green state.

16,271. (*Mr. Harrison.*) When your sewer is waterlogged during a flood is the sewage forced back into any of the cottages?—I think that it may be forced back into some cottages in a low locality.

16,272. Does not it come under your notice as the local board whether such is the case or not?—We know that the sewage does get flooded back into cottages, but we have no remedy at present.

16,273. You have created the nuisance; may not the parties look to you for the remedy?—We want some system of getting rid of the sewage.

16,274. Is it not incumbent upon your local board to take some steps for the purpose, and not to let those cottages be in that condition?—If we allow the sewage to come up the sewer I think that we should take it away, but when a flood comes, and flood and sewage are all in the houses together it is a difficult matter.

16,275. (*Chairman.*) Have you read of the drainage of Holland?—Yes.

16,276. There are enormous areas there many feet below the sea level?—I suppose so.

16,277. And they manage to keep the water out?—Yes.

16,278. With regard to your backwatered sewers, it is quite possible to sewer a place which is below high water and yet never to allow it to be flooded?—Yes, it could be done if we had doors to keep the water from coming up.

16,279. When a flood rose they would prevent the water from getting in, but of course they would prevent the sewage from getting out?—Yes. We have sometimes thought of another plan of cleansing the sewer, that is running the water into the sewer above the dam, and making an outlet for the sewer below the dam. I do not know whether the Aire and Calder Navigation Company would allow this or not; it would be an improvement. The lower part of Castleford is the worst, the upper part is well drained and well sewered, the difficulty is with the lower part.

James Horatio Simpson Esq., M.D., (Pontefract), examined.

16,280. (*Chairman*). You are resident in Pontefract?—Yes.

16,281. How long have you been resident here?—I think about 21 or 22 years.

16,282. Are you acquainted both with Pontefract and with Castleford?—Pretty well. I am acquainted with Castleford as having been its officer of health now for about eight or nine years, I think ever since the local board was formed, with the exception of the first three years.

16,283. What is the condition of the public health at Castleford as compared with Pontefract?—I do not know that I can speak as to the mortality of Pontefract, because I have never made any analysis of the returns, but I should think that Castleford stands in a better condition as far as regards its death rate than Pontefract. I am only speaking now from that which I recollect in the last two or three years. I do not think that the case was the same in the first two or three years of my appointment.

16,284. Pontefract, we understand, has neither surveyor, officer of health, nor anybody but a mayor, and a town clerk, and commissioner?—I do not know that it has had any surveyor, or any officer of health, until the last five or six months; and since the outbreak of cholera I think that one of the medical men was appointed officer of health during the last three or four months. A police constable has always acted as the inspector of nuisances.

16,285. In what state do you consider the present water supply of Castleford to be?—It is very bad.

16,286. Do the people complain of difficulty in obtaining proper water?—They have complained very much to me when I have gone round of the difficulty of obtaining water, and also of the supply of water in the wells diminishing, but I do not know that that was to be attributed to anything so much as the peculiarly dry weather of 1865.

16,287. Do you think that the water has increased in the wells since the last wet season?—Yes, except that the pumping of a coalpit which has been sunk has certainly affected it.

16,288. And if the operations of coal are extended I presume that the effect will be much more serious?—That I cannot tell.

16,289. In what state is the river as it flows past Castleford?—It is as bad as it can be; it is very much fouled by pollution, particularly the pollution of the towns above. Of course Castleford does its best to make it worse, like most other places on the sides of the river; I mean by throwing its own sewage into the river.

16,290. It receives the sewage in the river from above, and it puts in its own sewage to the injury of people below?—Yes.

16,291. Is it the fact that a great number of persons now drink the water of the river?—I do not think that many of them do, unless that has been so since the operation of sinking the coalpit. They do not do so in the town, because their reply to me was that they could not use that water, and that even boiling it did not take out its nasty taste.

16,292. Are there any waterclosets in Castleford?—There are only nine.

16,293. How many privies are there?—A great number; there are 438 privies.

16,294. And what is the population?—Above 6,000.

16,295. What amount of population would be represented if you took a privy to each family?—I do not know. A large number of the houses built in Castleford have been built in the last few years, many of them have been run up as a speculation, and others by private individuals as a matter of letting.

16,296. Have you much excrementitious matter upon the surface?—Not a great deal.

16,297. Where do the people go?—To the privies. The privies are very fairly constructed.

16,298. Do you think that there is sufficient accommodation for the population?—I should say not.

16,299. Then if there is not sufficient accommodation for the population, children and adults must be driven occasionally to the use of the bye-lanes and the streets?—I cannot say that there is much impurity of that sort in the streets. I should think that the poorer population in Castleford are far better supplied with privy accommodation than they are in most towns.

16,300. In the expression "most towns" do you include this in which we are sitting?—As to that I cannot speak. I think that there is about one privy for every three or four houses.

16,301. Then the word "privy" ought to be sponged out, because the word "privy" means privacy, and it cannot be a very privy thing if it has to serve four or five houses. In what condition are those places; have you ever as officer of health had your attention called to them; are they kept clean, or are they dirty?—The bulk of them are kept very clean; in some few cases they are not clean where they are attached to lodging-houses, or where there are old premises which cannot be interfered with by the local board without great trouble. Most of them are constructed in such a form that they will not take above a certain quantity, and I believe that the local board take care that they are very frequently emptied, at least that is what I have urged upon the surveyor.

16,302. You know very well that when that effete

matter is kept for a few weeks it becomes putrid?—Yes.

16,303. And when it has set up putridity it begins to ferment?—Yes.

16,304. And when fermentation sets in there are gases of decomposition given off?—No doubt.

16,305. Do you know whether those gases are injurious to health, or otherwise?—It is the opinion of many medical men that those gases are injurious, but there is perhaps an answer to them, namely, that the men engaged in cleaning out privies and things of that sort do not complain, and very often do not suffer as those who are not so engaged do. I should say that privies are objectionable so far as they are injurious to property, but whether they are injurious to health, unless they are very largely concentrated, I do not like to assert upon my own professional opinion.

16,306. Are you aware that it is a fact that in proportion as middens, cesspools, and cesspits have been removed from the midst of a population, and fermentation has been prevented, the health of the district has been improved?—There I quite agree with you.

16,307. Whether the gases are injurious directly or indirectly?—Yes, I quite agree with you on that point, that it is desirable that they should be removed (as frequently as they can be), and that extreme cleanliness should be used.

16,308. For instance, in the case of a privy attached to a cottage house, we will say that the bedroom window may open over the surface of that privy?—Yes.

16,309. If, as in many instances, the privy is positively projected underneath the sleeping room then any gases of decomposition will ascend into that room?—Then I should say that that privy is decidedly injurious to health, and that such a thing ought not to be allowed if it could possibly be avoided.

16,310. You know, I suppose, the symptoms of typhus fever?—Yes.

16,311. Do you agree with other medical men that that is what is termed the dirt fever, or a fever positively caused by something foul which is removeable?—I think that very likely it is attributable to those circumstances.

16,312. Over-crowding, bad clothing, bad lodging, and bad diet?—I would not say that it is always attributable to those circumstances, but it is very largely so, and if any germ of the fever exists those circumstances would develope it.

16,313. Do you know in what condition our gaols are at present?—No, except that they are free from fever.

16,314. Do you think that typhus fever never occurs in a gaol?—I know that the gaols are free from it.

16,315. And I suppose you know that inmates of gaols are most subject to typhus fever when in their haunts in towns?—Yes, but inmates of gaols are well fed and well clothed, and well looked after as regards water and other necessaries of life.

16,316. Are you aware that until Howard took up the question and examined and reported upon gaols, and pointed public attention towards them, gaols in this country were the very hotbeds of putrid typhus fever?—Yes.

16,317. And that so bad was it at one time that the judge, the counsel, and the jury were all smitten by the pestilence which was brought in by the prisoners who were placed at the bar at the great black assizes?—Yes, I am quite aware of that from reading books about it.

16,318. If typhus fever has been entirely removed from gaols, do you think that it might be removed from a town population?—I think that it might be removed to an enormous extent, far more than it is now; I would not say entirely.

16,319. If you can remove it to an enormous extent, why are you to stop short of entire removal?—That is a question which I cannot answer.

16,320. If you are called into a case of typhus, what kind of place do you generally go into to see it?—Unless the disease has been taken by communication from one person to another, I am generally called into a place where the people are ill fed, ill clothed, over-crowded, and dirty.

16,321. And those medical men who call it dirt fever do not very much misname it?—I do not think that they do.

16,322. Is it true that typhus fever is more fatal between the ages of 20 and 40 than in the cases of younger or older persons?—I should say that it is.

16,323. And that if it seizes an adult he has a very bad chance of recovering from it?—Yes, his chances are worse than those of a younger person.

16,324. Is it liable to leave ill effects behind it, supposing that a man's constitution will pull him through the crisis itself?—Yes, there is no doubt of it.

16,325. If you have cases of typhus fever in a town from foul air and filth which is allowed to accumulate, and if the head of the family is taken away, what becomes of the widow and the children if they are very poor?—In the greater proportion of cases they are thrown upon the township.

16,326. They become paupers?—Yes.

16,327. And if they are once pauperized, is it not most probable that they will remain so?—Yes.

16,328. That the poor woman and her children are put into a hopeless state?—Yes.

16,329. If it could be shown that any house, or any set of houses for a series of years had turned out typhus cases, that the head of the family had died, and that the family had been taken away to the parish to be maintained by the parish, do you think that, as a matter of pounds shillings and pence, it would have been true economy to have prevented that state of things by removing the conditions which caused the typhus?—Most undoubtedly it would.

16,330. Do you think that a parish may have directly and indirectly paid many times over the worth of such a house?—Yes.

16,331. If you have a family pauperized it is very difficult to calculate the money cost of that family to the community?—Most undoubtedly.

16,332. Do you think that local boards usually consider their duties in that light?—I should not like to speak of other local boards except the one which I have had to do with, but there are a great many allowances to be made for local boards. In the first place they have to contend with the prejudices of the town in which they are living; they have to find the pounds shillings and pence which provide for the works, and therefore, however willing they are to attend to the suggestions of their medical officer, of course there are very frequently difficulties independent of that which they cannot get over, such as the high rate of assessment and other things.

16,333. There are such things in government as direct taxation and indirect taxation, are not people generally irritable under direct taxation?—They are no doubt more so than under indirect taxation,

16,334. The rate of the local board levied for local improvements is direct taxation?—Yes.

16,335. But there is another species of direct taxation, the amount of which is accumulated indirectly, namely the poor rate, which a ratepayer must as certainly pay as the sanitary rate?—Yes.

16,336. If he is paying a large poor rate he may not see the causes which bring about that state of things, and he does not grumble at the heavy poor rate excepting as ratepayers grumble at rates of all sorts, but if the board, wishing to improve the sanitary condition of the district, proposes to levy a sixpenny rate he is dreadfully angry with that board, although that rate might save him a shilling poor rate, besides saving an incalculable amount of human misery?—That is just the case.

16,337. Then do not you think that the ratepayer wants to be educated into a true knowledge of the facts

PONTEFRACT.

J. H. Simpson, Esq., M.D.

30 Nov. 1866.

concerning him?—I am sure that he does, particularly as regards sanitary matters.

16,338. And these pollutions?—Yes.

16,339. My colleague, Mr. Harrison, says that it would be an incalculable advantage, both for the present and for the future, to Castleford if the ratepayers as well as the local board could see what the place would gain from wise and judicious expenditures at the present time?—Yes.

16,340. And that Castleford may suffer from something very much more oppressive than mere money rates; that wisely to expend rates upon preventive works is the truest economy?—There is no doubt about it. There is one thing I should like to mention, viz. the returns as regards fever.

16,341. Have you prepared any returns with regard to fever in Castleford?—I have. I make a report to the local board once in every 12 months, and sometimes oftener, and I have brought with me a copy of my last report made about six months ago.

16,342. Then you are prepared to lay before the Commissioners returns as to fever?—Yes. The death rate of Castleford last year was 16 in 1,000; it has been as high as 22 and 23 in 1,000, but it has gone on gradually declining. There were only 16 adult deaths in the six months from all causes. The improvements of the local board have tended to diminish the pauperism amongst the poor population who were able to work, and the result was that not so many women and children were thrown upon the poor rates in the last three years as in the previous three years.

16,343. If you by any measures of prevention diminish the class of disease which has been termed preventible, namely, typhus, typhoids, and other fevers, and if you reduce the death rate you diminish pauperism, and therefore you diminish the poor rate?—Yes. This report was made on the 3rd May 1866.

The witness delivered in the following report:

"To the Chairman of the Local Board of Health, Castleford.

"Dear Sir,

"I am glad that it is in my power to make a favorable report of the present state of health in Castleford, and those parts of the district under the jurisdiction of the local board, and also of the improvement in the general aspect of the streets, alleys, and yards as regards cleanliness and absence of causes likely to affect the public health.

"The result of my quarterly and more frequent inspections leads me to the conclusion that the inhabitants are more alive than formerly to the necessity of attention to those important matters conducive to health which are under their own immediate control, such as cleanliness about their own yards and houses, the frequent emptying of privies and ashpits, and the avoidance of all stagnant pools of water or other deposit, &c., and to this attention on their part and the strict inspection and activity of the inspector of nuisances, I am disposed to attribute the decrease in the rate of mortality during the past year. This decrease is caused by the absence of those diseases which are called epidemic, such as scarlet fever, and is especially among the younger portion of the inhabitants of the town. It is by them that the baneful influences which affect public health are the soonest felt, and therefore by them the absence is the more readily appreciated. A reference to the mortality of the past year and former years bears me out in these remarks.

"The arrangement of the privies communicating with the open ashpit is not one of the best. I do not see any means of altering this, unless the local board issue a general order by which the open ashpits are covered in or the privies constructed with a moveable trough or box which would be regularly and frequently emptied at short stated intervals by the scavengers, and the refuse taken to some depository where it could be deodorized and converted into manure. Such a plan would of course require a proper system of scavenging, but I have no doubt of its benefit in a health point of view, and I think that it would be commercially successful.

"I have had good-natured complaints made to me respecting the effluvia arising from the slaughter-houses. There is no means of obviating this and the deposit of the offal as at present by the butchers but the plan of erecting public slaughter-houses for the use of the butchers generally.

"I find the death rate in Castleford for the past six months to be a total of 59, as follows: Infants under 2 years, 24; children from 2 years to 10 years, 6; adults under 20 years, 10; from 20 to 50 years, 3; under 80 years, 16.

"There have been no deaths from scarlet fever, few from whooping cough or measles. The deaths among the children are chiefly from convulsions, teething, &c. I wish particularly to point out the fact that there are only 19 deaths from all causes between the ages of 2 years and 50. This, in a population of nearly 6,000, is a low rate of mortality. Among the 19 fever has claimed six victims.

"The sanitary condition of Castleford contrasts favorably with that of Whitwood or Glass Houghton, and it would be satisfactory to ascertain if the decreasing mortality in the adult population of the place during the past two years has had any material influence on the pauper population, i.e., on the number of widows or children who have been thrown on the township, for in this direction the benefit of sanitary improvements ought to tend. The number of deaths from fever in Whitwood during the six months has been nine, and this, in a population of not more than two-thirds that of Castleford, shows the unhealthy character of that district. I would strongly advise the adoption of some measures conjointly by the Castleford Local Board and the ratepayers of Whitwood by which sanitary remedies could be applied to that district. It was at Whitwood where the smallpox first appeared; it is there that scarlet fever and typhus always prevail, and I am afraid that if the summer should be favorable to the spread of epidemic or contagious diseases, it will be there that the first plague spot will show itself to extend to the surrounding district of Castleford.

"It is highly desirable, as a completion to any scheme of sanitary improvement, that a good supply of water should be available. This is not in existence at Castleford. The surface wells in use are liable to be influenced by various causes, and their supply may at any time be greatly lessened or vitiated, and then disease follows as a natural consequence of an impure article of food. I should fail in my duty if I did not direct the attention of the local board to this point.

"I have to report that the lodging-houses, as a general rule, are clean and not over-crowded.

"I am, dear-sir, your obedient servant,
(Signed) "J. H. Simpson, M.D.,
"Pontefract, May 3rd, 1866. Officer of Health."

16,344. Have you the annual death rate for any number of years back?—I have it for several years back.

16,345. Will you to-morrow state the death rate from the earliest period, year by year?—Yes.

16,346. Is there anything further which you wish to state to the Commission?—I should like to confirm what has been said about Whitwood, the portion adjoining Castleford, which is not under the local board of health. Its condition as a district is quite what Mr. Heptinstall, the chairman of the local board, has stated; it needs sanitary improvement to a very great extent.

16,347. Do you think that they will be wise enough to take the steps which I have suggested, namely, to petition the Secretary of State to allow them to adopt the Act?—I should almost think that they would, for it is not many months since I was present at a meeting at Whitwood, and I think that the general feeling then was to adopt the Act. It was before the last Diseases Act passed, and the communication from the Secretary of State was rather against their being able to adopt the Government Act.

16,348. On account of the population?—Yes; but since that the new Diseases Act has been passed.

16,349. What is the population?—Between 2,000 and 3,000.

16,350. I see that at the period when the report before me was made, namely, in 1850, there was a death rate of 27·4 per 1,000?—That would be before my appointment.

16,351. Have you anything further to state?—I would make one remark about the casual outbreaks of cholera since I have had to do with Castleford, namely, that I think that they have generally been attributed

PONTEFRACT.

J. H. Simpson, Esq., M.D.

30 Nov. 1866.

to soakage of sewage into well-water, and I do not know that they can be attributed to the use of privies in the town. I think that they were more attributable to the liquid matter from fold-yards and other places of that sort, and to heaps of manure than to any conveniences constructed for the use of the inhabitants.

16,352. But have you reason to believe that in some degree the cholera arose from the use of impure water?—I am sure that it did, because in one or two cases where the wells were locked up, and charcoal and lime were thrown in, the cholera ceased.

16,353. Then with regard to the water supply you think that the local board have a great responsibility resting upon them if they permit any impure water to be used for domestic purposes?—Yes, if they have the power to prevent it.

16,354. Is there a difficulty in obtaining water for Castleford?—A river water has been analysed, namely, the Mere, which Mr. Heptinstall has spoken of, and there my own chemical examination proved that that water was very soft, but that there were evidently traces of chemical impurities coming down the river; it was coloured, and you could not get rid of the peculiar taste of the water, no filtration or boiling took it away; it was the exact taste of the river water; that impurity must have been produced by soaking.

16,355. (*Mr. Harrison.*) Are you at all connected with Knottingley?—Only as a medical man going down there and knowing the place well.

16,356. How is it off for water?—It is only supplied by well water; and one effect of the last flood at Knottingley was, that the people were unable to use the wells for some little time afterwards in consequence of the impure water floating over the land and finding its way into the wells.

16,357. Then should you say that Castleford and Knottingley are two striking instances upon the river Aire of towns badly situated for obtaining water from any other source than the river itself?—I should think that both of them are in that position, they could not get water except water strongly impregnated with time.

16,358. Therefore they are deeply interested in the purification of the river Aire?—I should think so more than the towns higher up.

16,359. If the rivers Aire and Calder were effectually purified, would those rivers be a suitable source of supply for those two towns?—I think so; as much as they were when I first knew them; they were then very largely used in both towns, but now they are scarcely used at all.

16,360. If those rivers were purified, do you believe that the inhabitants could not get water equally soft or equally pure from any other source in the neighbourhood?—I think not, unless they went to a very deep well.

16,361. Is Knottingley sewered?—Yes, but the sewers are merely the old-fashioned sewers; it is not under a local board.

16,362. Is the sewage turned into the river?—Yes.

16,363. You are not medical officer to the board of Knottingley?—There is no local board. I merely speak as a practitioner, knowing Knottingley and passing frequently through it.

16,364. Is there any authority in Knottingley to inspect the town and keep it clean?—No more than there is in any other town.

16,365. There is no corporation?—No.

16,366. There is no local body?—No, except what may be constituted by the poor law.

16,367. Do you know what is the condition of the town as to privy accommodation and so forth?—No.

16,368. Have you any practice in the Marshlands below?—Not much.

16,369. Is the land opposite Knottingley subject to flooding?—Yes, all Brotherton Marsh is.

16,370. Do you practice there?—There are not any houses upon the marsh, but adjoining the marsh there are some, but that is upon high land. I do not think that they would be at all influenced in the higher lands by the effects of the floods.

16,371. Does the population below Knottingley become sparse?—There is only Beal, a village below, which would be influenced by flooding, and whatever applied to Knottingley would apply to Beal in a measure.

The witness withdrew.

Mr. T. Simpson.

Mr. Thomas Simpson (Castleford) examined.

16,372. (*Chairman.*) Where do you live?—At Castleford.

16,373. Do you carry on any business?—I am a glass bottle manufacturer.

16,374. Where are your works situated?—At the west end of the town.

16,375. Do you use the water of the river?—No.

16,376. How many years have you been resident there?—61 years.

16,377. For how long can you remember the condition of the river?—For fifty years.

16,378. In what state is it now as compared to what you remember it to have been?—It is now very badly polluted, but fifty years ago it was clear and pure, and it was used for all domestic purposes. There was no other water then; there were not two wells in the town then; everybody used the river water.

16,379. What number of hands do you employ?—150.

16,380. What quantity of coal do you consume in the year?—7,850 tons.

16,381. What do you do with the ashes?—They go into the byroads to fill up holes.

16,382. Not into the river?—No.

16,383. Do you make any smoke?—Yes.

16,384. Does anybody complain of it?—There are a few odd persons that do complain; they do not derive any benefit from it, or they would not complain.

16,385. Is it possible, do you think, to carry on your business without making smoke?—I cannot say; there have been many schemes that have been brought out.

16,386. What kind of bottles do you make?—Both pale and black; the body of the glass is sand and lime and chalk.

16,387. Do you use flint?—No.

16,388. Where does the sand come from?—From Lynn, in Norfolk, by a vessel.

16,389. Is it a white silicious sand?—Both white and red.

16,390. You do not get the best quality of sand which comes from France?—No, we do not get that.

16,391. What weight of glass do you make per week?—One house per week, two tons a day.

16,392. How many houses have you?—Three.

16,393. How long have they been established?—About 22 years.

16,394. If it could be shown that you could perform all your operations at less cost by the use of gas and without smoke should you object to make an alteration?—No, we should be very glad; we should do what could be done.

16,395. Do you use coal or slack?—Both, but more slack than coal.

16,396. What do you give a ton for the coal?—For smudge, 3*s.* and 3*s.* 6*d.*

16,397. Do you get it laid down for 3*s.* 6*d.*?—No, there is the carriage besides that; it will cost 6*s.*

16,398. What will the best coal cost laid down?—8*s.* or 9*s.*

16,399. Is the smudge cheap at 6*s.* as compared with the best coal at 8*s.* or 9*s.*?—We think so.

16,400. Are you quite sure of it?—It does not take so much money as it used to take when we used coals. We have a good draught.

PONTEFRACT.
Mr. T. Simpson.
30 Nov. 1866.

16,401. Are you a member of the local board of Castleford?—Yes.

16,402. Have you had to discuss with them the questions of sewerage and water supply?—Yes.

16,403. What is your opinion; is there any hope of your being able to help your poor neighbours with a better supply of water?—We hope so.

16,404. Have you done something in the way of sewerage?—Yes.

16,405. Do you intend to do something more?—Yes; we must have the sewers ventilated.

16,406. What accommodation have you provided upon your premises for your men; any waterclosets?—No, privies.

16,407. What becomes of the refuse?—We take it out on to the land.

16,408. Is it found beneficial for agricultural purposes?—Yes.

16,409. Do you throw any refuse into the river?—No.

16,410. Ought not the river to be dealt with so as to prevent the pollution that has been going on?—It is very necessary, and it ought to be done.

16,411. Do you know that it is a common practice for people to throw solid materials into the river, such as ashes, road dirt, and foundation materials?—No doubt it is so.

16,412. Is not that done in Castleford?—I think not.

16,143. You are, I suppose, a heavy ratepayer in Castleford?—Yes.

16,414. At how much are you rated?—Not quite 400*l.* per annum.

16,415. Your rates are very heavy?—Yes.

16,416. Have the rates been increased since the local board came into existence?—Yes.

16,417. Do you think that the money is expended badly?—No, I think they use all the economy they can.

16,418. If you are better off for the money that is expended I suppose you think the money is well laid out?—Yes, the roads are better, and road making is the most costly item.

16,419. Is the health of your townspeople better than it was?—Yes, better than it used to be.

16,420. Are the poor rates as high as they used to be?—I think they are higher.

16,421. (*Mr. Harrison.*) How many hands do you employ?—150 men and boys.

16,422. How many families would they represent in the town, or how many women and children are dependent upon them?—I do not know; some of them have large families and some small ones, and they have a few apprentices.

16,423. Your works probably add to the population of Castleford 1,000 persons?—Not so much as that.

16,424. What other works are there in Castleford besides yours?—Plenty more glass works.

16,425. What number of hands do you suppose are employed?—There are 23 glass houses. I have only three.

16,426. What number of hands would they employ altogether?—Three houses will average 220 men and boys.

16,427. Has the glass trade risen in Castleford within the last twenty years?—The last thirty years.

The witness withdrew.

Mr. W. Hunt.

Mr. William Hunt (Castleford) examined.

16,428. (*Chairman.*) Do you reside in Castleford?—Yes, I have lived there the last two years.

16,429. (*Mr. Harrison.*) In what business are you engaged in Castleford?—I am a manufacturing chemist.

16,430. What description of chemicals do you manufacture?—I make sulphuric acid, sulphate of soda, muriatic acid, and chloride of lime.

16,431. Are you an alkali manufacturer?—I am just now beginning to make alkali for the glass works.

16,432. The glass manufacture has caused you to make alkali?—Yes.

16,433. Where do you get your salts from?—From Droitwich at present.

16,434. What quantity do you use in the year?—At present in this locality I use about 30 tons a week.

16,435. And that at the commencement of the trade?—Yes.

16,436. (*Professor Way.*) Do you condense the muriatic acid?—Yes.

16,437. Within the provisions of the law?—Yes, I must do that.

16,438. Within five per cent.?—Less than that.

16,439. What becomes of that acid when it is condensed?—I use it with manganese to produce chlorine for bleaching powder.

16,440. Is it all made into bleaching powder?—I sell occasionally a little muriatic acid.

16,441. (*Chairman.*) Does Dr. Angus Smith visit you occasionally?—Yes, he was there last Friday.

16,442. How often does he come?—I cannot say; he is there sometimes when I am not there; he comes in just when he likes.

16,443. He does not give you any notice when he comes?—No.

16,444. Has he an inspector under him?—It is not Dr. Angus Smith himself who comes; it is one of his inspectors; he has been there once.

16,445. Is the inspector who visits you the inspector for the district?—Yes.

16,446. Dr. Angus Smith visited your works when you first began?—Yes.

16,447. Does the same gentleman come always?—I have never seen any other.

16,448. Has he any apparatus to test what passes from your premises?—Yes.

16,449. Is it under lock and key?—Yes, in a particular place; we never touch it; he comes there and has access to it without saying anything to anyone, and is able to ascertain the state of things going on by going into the stack.

16,450. Does it indicate what is going on?—Yes; I have used the machine perhaps three times in the course of the time it has been up, not more; I have access to one myself.

16,451. Do you sell hydrochloric acid?—Yes, I sell some.

16,452. What quantity of hydrochloric acid produced in this country is converted into chloride of lime; it it all converted, or only half?—More than half. I should think that three-fourths of it are converted into chloride of lime.

16,453. Is any of it thrown away in the river?—I think not, it is too valuable for that.

16,454. (*Mr. Harrison.*) Are you not aware that a large quantity passes from alkali works on the Tyne into the river?—I was not aware of that.

16,455. (*Professor Way.*) At what price can you supply hydrochloric acid?—I am selling it now at 1*s.* 6*d.* a hundredweight, delivered on to the rails.

16,456. That is 30*s.* a ton?—Yes.

16,457. It is to be had sometimes cheaper than that?—I have sold it at 1*s.* a hundredweight, and sometimes less than that.

16,458. You do not throw any portion of the hydrochloric acid into the stream?—No, I cannot afford to do that.

16,459. Do you make sulphate of soda, the salt cake, into soda?—I have just begun to make it into white ash.

16,460. Soda ash?—Yes; I have to make sulphuric acid in order to make sulphate of soda.

16,461. There is no discharge from the chamber of any kind?—No. I have a condensing tower attached to each chamber, and after the fumes have passed

PONTEFRACT.

Mr. W. Hunt.

30 Nov. 1866.

through this small condensing tower all the gases go together into another large tower.

16,462. Do you pump the acid up to meet those gases?—No, I have not done that of late; I find that I get such perfect condensation that I do not force the chambers.

16,463. There is nothing going up them?—Nothing that is condensable; there may be azote or something of that sort.

16,464. You put acids up in the first instance to stop something that was likely to pass up the chambers?—Yes.

16,465. You now think that nothing goes up because the process is so perfect, and therefore acids are not wanted?—In the first condensing tower we get a little, but not at the other, at the large one.

16,466. Is there any form in which you at all pollute the river?—I send the muriate of manganese into the river, the chloride.

16,467. Is it not too valuable for that?—I have not turned it to any account.

16,468. Does it not precipitate sewage?—Yes, but it is too bulky; people prefer chloride of lime.

16,469. In towns?—Yes.

16,470. Have you sold any of it at any time?—Not in this locality; I have sold some little in Staffordshire for steel making.

16,471. For the purpose of introducing the manganese into iron?—Yes.

16,472. Do you make very large quantities of that chloride of manganese?—Yes, in Staffordshire; not here.

16,473. Can you sell it at a low price?—Yes.

16,474. Is it a strong solution?—It will be about 40 and 12.

16,475. You throw that into the river?—Yes.

16,476. I suppose it will be quite easy to add some lime to it, and precipitate the manganese?—I have had that in contemplation of late, and I have found that glass makers use a little manganese.

16,477. If the clear solution had a little lime mixed with it you would then have oxide of manganese, and you might let the liquid from that flow off without injury?—Yes, but it is not such an oxide as we can use for making chloride of lime; it is a sesqui-oxide.

16,478. You do not I believe consume a large quantity of coal?—About 60 tons a week now.

16,479. Is that principally used in firing the reverberatory furnaces?—Yes, for generating steam.

16,480. For the sulphuric chambers?—We have an engine to force the water up to the top of the condensers.

16,481. Have you anything further to add?—No, except as to the watercourse that empties itself into the river within fifty yards of my works. It is a great nuisance; it comes from the township of Whitwood, half a mile further west.

16,482. Do the people there discharge their sewage into the stream?—Yes; there is a great number of cottages there and very little fall, and soapsuds and other matters lie there and generate a deal of sulphuretted hydrogen, and the smell is very bad in summer time.

16,483. You would no doubt be glad if some measure was passed to compel them to abate that nuisance?—Yes.

The witness withdrew.

Mr. W. Wilson.

Mr. William Wilson (Castleford) examined.

16,484. (*Chairman.*) Are you manager of the Castleford gasworks?—No, I am engineer for them.

16,485. Do they belong to a company or to the township?—A company.

16,486. How long have they been established?—14 years.

16,487. What number of retorts have you in use?—We have five clay retorts, five iron ones, and two brick ovens.

16,488. What volume of gas do you make per annum?—About 6,000,000 of cubic feet.

16,489. What price do you charge?—5*s.* per 1,000 cubic feet.

16,490. What do you pay for coals?—About 10*s.* a ton.

16,491. What weight of coal do you use in a year?—About 900 tons.

16,492. How much coke do you make?—Something like 12 cwt. to a ton of coals.

16,493. What do you get for your coke?—10*s.* a ton.

16,494. What do you get for the gas tar?—We sell it as a whole; we make about 5*l.* a year for the tar, and for the ammoniacal liquor something like 8*l.* or 9*l.*

16,495. What do you purify the gas with?—Dry lime.

16,496. Have you any difficulty in getting rid of it?—No; we sell it at 1*s.* 6*d.* a load.

16,497. What do you do with the ashes you make?—They are carted away.

16,498. Is there any form of pollution that passes from your premises into any stream?—Not anything, nor has there ever been.

16,499. Then gas, you would say, may be made without rendering any river impure?—Yes.

16,500. If the operations in any gasworks are so carried on as to pollute a stream, do you think there would be any hardship in restraining the parties from doing so?—No; I should say there was bad management if they did so.

16,501. What number of men do you employ?—Five in winter and three in summer.

16,502. Are your works near the river?—Yes, they are close on the banks.

16,503. How long can you remember the place?—I have been in business in Castleford for 34 years. My first establishment was close by the river side.

16,504. In what condition is the river now compared with what it was then?—It is very different from what it was then. I fished in it for many an hour 30 years since.

16,505. Do you ever see any indication of refuse from gasworks coming down the river?—No, I have not noticed that; I think we have none near us that pollute the river.

16,506. Do you suffer from a deficient water supply?—Yes, we have had plenty of water in the town; but recently the sinking of a coalpit near us has taken the well water away.

16,507. Are you a member of the local board?—Yes.

16,508. Have you discussed with them the propriety of getting a better supply of water?—Yes, and the local board have engaged me to find a supply. Castleford is just in the midst of a coal field, and it is difficult to get a supply, however we found some water at a place about a mile from Castleford, but it was somewhat too hard, and we then turned to the old river. We found from analysis that it was not suitable, and we are now in hopes of getting water from another source, a colliery pit; the sinking of it drained our wells, but they are now pumping 800 gallons per minute, and we think that water will be very suitable for us.

16,509. If it does turn out to be suitable will the local board secure a supply for the use of the people?—My instructions are to set about getting it immediately; we are now testing the quality of it, and if it is found to be sufficient in quantity we shall have its quality tested more accurately, and if it proves of such a quality as will be suitable we shall certainly use it. We have a situation for a reservoir to pump the water into, and from that reservoir there is a sufficient fall into the town.

16,510. Are there any observations which you wish to make, or any facts you desire to state bearing upon this inquiry?—I believe that the local board, although it is not for me to say so, are very wishful to do everything they can to improve the health of the town. In

reference to a question put by Mr. Harrison to our chairman as to preventing the flowing back from Castleford to Knottingley, I may state that that is the first dam below Castleford, and it has a very little fall indeed. Before our local board was established we had Mr. Babbage to make a survey here, and his first idea was to carry down the sewage to Knottingley. I went with him over the district, but when he had been over it he abandoned that idea altogether, and he said that he could not get fall enough for the sewers to empty themselves. With regard to the system of sewerage which we have now we had an inspector down from London to examine the plan before it was carried out.

16,511. Is not a considerable part of the town situated on rising ground ?—Yes, a part of it.

16,512. The part where the town is being extended is on high ground ?—Yes.

16,513. Your town is a rapidly increasing one, is it not ?—Yes.

16,514. From all that higher ground there would be no difficulty in carrying the sewage on to the land below ?—We might carry it from the higher part of the town on to the land below.

PONTEFRACT.
Mr. W. Wilson.
30 Nov. 1866.

16,515. In carrying out your system of sewerage would it not be well to keep that point in view and lay out the sewers so that the sewage from all the houses that are likely to be built in the upper parts of the town might be carried down and used to irrigate the land below ?—Yes, and it shall not be forgotten. I am indebted to Mr. Hunt for an analysis of the water I have spoken of, which I will hand in (*handing in the same*).

16,516. (*Professor Way.*) The water that you spoke of before, and which was analysed by Mr. Newsome, came from an old mine ?—Yes.

16,517. You know that that is very alkaline ?—Yes, and we have abandoned that water.

The witness withdrew.

Adjourned till to-morrow at 11 o'clock.

Pontefract, Saturday, 1st December 1866.

PRESENT :

ROBERT RAWLINSON, ESQ., C.B., IN THE CHAIR.

JOHN THORNHILL HARRISON, ESQ. | Professor JOHN THOMAS WAY.

Mr. JOHN CARTER (Knottingley) examined.

Mr. J. Carter.
1 Dec. 1866.

16,518. (*Chairman.*) What are you ?—I am a brewer at Knottingley.

16,519. You carry on your business at that place ?—Yes.

16,520. Are your works situated near the river ?—Near the canal.

16,521. Where do you obtain your water ?—From a well of our own.

16,522. What class of water is it ?—It comes from the magnesian limestone in our neighbourhood ; it is hard.

16,523. What volume of water do you use in a week or a month ?—I cannot say.

16,524. You pump it ?—Yes.

16,525. How long have the works been established ?—For 60 years.

16,526. What quantity of beer do you brew in a year ?—I cannot say.

16,527. Is it a large or a small quantity ?—It is a large one.

16,528. Do you brew pale and bitter beer ?—Yes.

16,529. For the foreign market ?—No.

16,530. Is your hard water better suited for pale beer than a softer water ?—We do not find any very great difference.

16,531. I believe Burton water is hard ?—Yes ; it was supposed by many people that Burton water was always taken from the river, but that is wrong ; the brewers there have wells of their own.

16,532. Are their wells in the same stratification that yours are in ?—No, I think not ; I think their wells are more in gravel.

16,533. With regard to the water you use in washing out casks, and other waste water, what becomes of that ?—It goes into the canal.

16,534. Has that been objected to at any time ?—Never ; upon that part of the canal where the water goes into the Aire and Calder they have never made any objection to it.

16,535. How many men do you employ ?—23 or 24.

16,536. What becomes of the sewage from your premises ; have you aspits and middens ?—Yes ; the sewage does not go near the canal.

16,537. I may assume that you do not pollute the stream ?—Not at all, except by the water from the washing of the casks, which goes into the canal.

16,538. And the canal people do not find fault with it ?—Never.

16,539. Have any of your neighbours found fault with it ?—Never.

16,540. Have you any other remarks to make ?—Simply this : I think that the reservoir near to Pontefract has ruined the nice stream that used to flow down into the river. I often perceive, in driving up in very hot weather, a stench from the reservoir.

16,541. That is a sewage tank, is it not ?—Yes.

16,542. Which the Pontefract people have made ?—Yes.

16,543. You think, if they wish to do their duty to themselves and their neighbours, they might find some other method of removing the sewage than putting it into that tank ?—Decidedly.

16,544. Have you no such tank connected with your premises ?—No.

16,545. (*Mr. Harrison.*) The liquid sewage after passing from the tank goes into the canal, and is then conveyed through Knottingley ?—Yes.

16,546. Where do the people of Knottingley obtain water for domestic purposes ?—Many of them obtain it from the canal.

16,547. Do you think that that is a desirable state of things ?—By no means.

16,548. Could you dispose of your refuse otherwise than by passing it into the canal ?—No, we could not ; it is impossible.

16,549. Could you filter it ?—I do not know whether we could do that or not.

PONTEFRACT.

M. J. Carter.

1 Dec. 1866.

16,550. It is not any large volume of water, is it?—Yes.

16,551. How many gallons do you use in a day?—Many hundred gallons; I cannot speak to the quantity exactly.

16,552. After all, when the waste liquid goes out of the brewery into the canal, it is merely discoloured water; there is no kind of refuse in it, is there?—No.

16,553. It was stated yesterday that at the brewery near this place there was some kind of refuse which was very objectionable?—Yes; I understand that they throw in refuse hops, and sometimes grains; they can be sold for manure. We never let them go into the canal.

16,554. (*Chairman.*) I suppose hops become putrid and stink?—Yes, but they are generally led away from the place at once; we sell them to a farmer, he takes them away every three or four days if they are objectionable. There is nothing that goes into the canal from our premises except the washings of which I have spoken

The witness withdrew.

R. Moxon, Esq., J.P.

RICHARD MOXON, Esq., J.P. (Pontefract), examined.

16,555. (*Chairman.*) Where do you live?—At Pontefract.

16,556. Are you engaged in any business?—I am in the malting trade.

16,557. Do you use much water?—A good deal; we use the town's water, and we pump a large quantity from a spring of our own coming from the limestone.

16,558. Where does the waste water go to?—The waste water from the malting premises, after the barley has been steeped, runs into the town sewer and goes down to the tank.

16,559. How many men do you employ?—From 50 to 60 at least.

16,560. Have you privy accommodation on the premises?—Yes.

16,561. Does the refuse go into the sewers?—No, we have ashpits behind, and the refuse is carted on to land by ourselves.

16,562. Is there any waste of any kind from your premises that goes into the stream besides what you have mentioned?—Nothing but from the maltings; the water rather smells, and is objectionable in the spring, but it has been found to be rather an advantage to the sewers, as the large rush of water has sometimes tended to cleanse them.

16,563. If that water, after the malt has been steeped in it, could be put on to land by way of irrigation would that be beneficial, do you think?—No doubt it would be highly beneficial; perhaps no town in England affords such a fall for carrying sewage or refuse away as Pontefract.

16,564. You think that if the Pontefract people were to put their shoulders to the wheel, and to look about them and do what they could, they might find ground to put the refuse on?—Yes, no doubt of it; I have been in the corporation more than 20 years and am also one of the Street Commissioners. The difficulty is that there are two governing bodies; there are 16 members of the corporation and about 32 of the Street Commissioners, and the one body clashes against the other. I have tried as hard as I can, but you can get no permanent improvement made except by compulsory means.

16,565. Do you know that if two-thirds of your number would vote for the adoption of the Local Government Act it might be put in force?—Yes; and I have brought that subject before the corporation, and if I could have carried it I would never have left the corporation; it would have been a great blessing.

16,566. There is a divided responsibility; the Street Commissioners have jurisdiction in one way, and the corporation is supposed to have jurisdiction in another way?—Yes, and they pull contrary to each other; we can get no drainage carried out. The only drain that there is I got constructed, but there is no shaft to it.

16,567. The Street Commissioners who have charge of the pavements and the sewering and other improvements are not amenable to the ratepayers?—No, they are not amenable; they do not produce any account to the ratepayers; they do not show any accounts to the inhabitants how the money is expended. Supposing it happened that a set of idiots being owners of property were elected, you could not turn them out of office; whatever mistakes they might make you could not bring them to book.

16,568. If the ratepayers of Pontefract, who have the matter in their own hands, would elect into the council men pledged to bring in the Local Government Act, the commissioners must go out?—They will not elect any men into office who are desirous of making any improvements; if they are disposed to spend any money they must not go into office. Candidates may make flowery speeches, but if they attempt to effect any public improvement they will never get in. I have always recommended that the area of the borough should be extended, and then the ratepayers would be able to appoint and pay a competent surveyor. Until that is done, they have no power except to appoint a few old women to hospitals; there are 16 members of the corporation, and I do not believe there is a worse paved town in England than this is. Although I am the largest ratepayer I cannot compel them to pave the streets, but I do not intend to pay any more unless they pave the streets. I am willing to pay anything if they pave the streets and drain them.

16,569. (*Mr. Harrison.*) It appears that in Pontefract the death rate is 26 in 1,000, whereas that of the adjoining town of Castleford is only about 16?—I believe that if Pontefract was properly attended to in water supply and drainage there would not be a healthier town in the United Kingdom, with such a fall as it has. In my house I have adopted a method of flushing. I have a large cistern, and I let the water out and flush the drainage. If that was done in the town, or the sewage was carried away, it would be greatly better; the new drain at a cost of 1100*l.* has really done more harm than good; the stench from it is unbearable.

16,570. Do not you think that the corporation and the commissioners, in dealing with the money collected in the town, should seriously consider the question of the health of the inhabitants?—Yes, most seriously; we wish that the Government would send down a commissioner to report and inquire upon the matter, and say, If you will not do what is necessary we will compel you, for what can one individual do in the matter?

16,571. We sincerely hope that the ratepayers will take the whole matter into their consideration, looking at what has been done elsewhere, and remembering that neglect is most expensive in the end, and that divided government is not only inconvenient and cumbersome but inefficient?—I quite agree, sir, with every word you have spoken. I was turned out because it was found I was in favour of getting a better supply of water. We are suffering from a great hardship, for, in addition to the pollution that we make ourselves, we have all the drainage of Tanshelf emptying itself into the watercourse.

The witness withdrew.

JAMES HORATIO SIMPSON, Esq., M.D., further examined.

PONTEFRACT.

J. H. Simpson, Esq., M.D.

1 Dec. 1866.

16,572. (*Chairman.*) You wish, I believe, to add something to your evidence?—Yes; you asked me to give you a return, if I could, of the number of deaths from 1860 to this time. I cannot give it you for the whole number of the months, but I can give it you for nine months in each of the following years, from 1860 to 1865. I can also give you the number of adults who died of fever, and it will appear that there has been a diminution.

16,573. As improvements have been carried out you find that the fever death-rate has diminished?—Yes. In 1860 I do not know the number of adults that died from fever; in 1861 the number of adults who died from fever was 7 out of 88; in 1862 the number of deaths in nine months was 89, and that of deaths from fever of adults 9; in 1863 in nine months the deaths were 78, there being 4 adults who died from fever; in 1864 in six months there were 54 deaths, and 3 adults died from fever; in 1865 in six months there were 57 deaths, and 3 adults died from fever—by adults I mean persons between the ages of 18 and 50. The cases of fever are generally at the part of Castleford adjacent to the township of Whitwood, where no sanitary measures are adopted. I may also state that the population of Castleford as well as of Whitwood has increased by more than one-third in the six years of which I have given you the death-rate.

The witness withdrew.

GEORGE PAUL ATKINSON, Esq., M.R.C.S. (Pontefract), examined.

G. P. Atkinson, Esq., M.R.C.S.

16,574. (*Chairman.*) Are you in practice in Pontefract?—Yes.

16,575. How long have you practised here?—In this neighbourhood nearly 25 years.

16,576. What is the state of public health now as compared with what it has been within the period of your recollection?—I am of opinion that fever and epidemic diseases have decidedly increased upon us.

16,577. They have been increasing for some years past, and you have carried out, or rather the commissioners have carried out, what they consider to be an improvement in main sewerage, at an expense of some hundreds of pounds, but not with any beneficial effect, is that so?—I must be understood not to express myself as to Pontefract merely, as I have only resided here for seven or eight years. I have also resided in the immediate neighbourhood, close to the boundary of the borough.

16,578. As to Pontefract, do you know anything of its special conditions?—I believe there are many conditions which contribute to the heavy death-rate of Pontefract.

16,579. What are those conditions?—There are social conditions which tell as well as ordinary causes, like neglect of sewerage.

16,580. What are those social conditions?—I think there is an excess of intemperance.

16,581. Do you think that bad cottage accommodation and bad sanitary arrangements at home have anything indirectly to do in compelling men to resort to public-houses?—I do think that the alleys of this place are very narrow and confined. It is an old built town, and there are many houses on a small space.

16,582. Crowded together?—Yes.

16,583. If they have privy accommodation of any kind, is it situated close to the dwelling house?—I am sorry to say that the accommodation is very variable; in some of the old parts of the town it is deficient; but I am speaking now more particularly of old alleys which constitute the old part of the town.

16,584. Have you any remarks to offer to the Commission, from your experience in these matters, as to sewerage or outfalls?—My opinion is that the state of the sewerage is not so perfect as it might be. I think that offences have been frequent in the course of the sewerage, and likewise down at the outfall tank.

16,585. Has it occurred to you that any other system would tend to get rid of these nuisances?—Yes. I have been of opinion that it was desirable to adopt some definite system of disinfection of the sewers in order to counteract and destroy the offensive and injurious gases which prevail there.

16,586. Are you aware that if sewage could be passed away fresh, day by day, and could be placed on land for agricultural uses, it never would be offensive?—I am aware that land acts as a deodorizer of sewage.

16,587. Are you aware that the effete matter of to-day is not corrupted to the same extent as it would become this day month?—Certainly.

16,588. That is a self-evident fact?—Yes.

16,589. If the effete matter of an individual would become corrupt and foul by keeping, it is clear that the effete matter of a town, if kept by any arrangement, as in these sewers and tanks, until putridity sets in, would become a mass of corruption and be offensive and dangerous?—Yes, certainly.

16,590. Then if it were possible to deal with that matter daily as it is produced, and thereby to prevent decomposition, you would get rid of that form of injury?—Certainly, and that is my object.

16,591. When you say disinfection, do you mean disinfecting by chemicals?—Yes.

16,592. But chemicals cost money?—Yes; they do.

16,593. You have an amount of mischief set up, and you propose to attempt to remedy that by using chemical disinfectants?—Yes.

16,594. If you caused the material to be used before putridity was set up, you would require no chemicals. I mean if the material was put on the land?—No; but at present we are not in a condition to do that.

16,595. Would it not be worth the while of the Street Commissioners to rent two or three acres of land and relet it with the condition that the farmer should apply the sewage daily to it?—I should not object to utilizing sewage on land, on the contrary I have always approved of it; but I speak with reference to the present state of things, and I argue that the present state of things is one fraught with considerable danger.

16,596. And expense?—Yes, certainly. But I look at things as they exist this year and will exist next year, and I argue from that that something is really called for, and that something I believe to be a system of disinfection, as the only means that we have to meet the difficulty.

16,597. That is for immediate purposes?—Yes, or until some different system can be adopted.

16,598. I suppose it would be within the province of the commissioners to use disinfectants?—I apprehend it would.

16,599. And not the corporation?—I am not able to say. There is a sanitary committee and an inspector of nuisances.

16,600. But they are not empowered to construct sewers, are they?—I believe not.

16,601. That falls to the commissioners to attend to?—Yes.

16,602. And the commissioners are not amenable to the ratepayers?—I believe not.

16,603. They are not elected by them?—No.

16,604. The ratepayers choose to be governed by men whom they have no control over and cannot direct in any way?—Yes.

16,605. They can neither elect them nor turn them out?—No.

16,606. If the Local Government Act was put in

PONTEFRACT.

G. P. Atkinson, Esq., M.R.C.S.

1 Dec. 1866.

force all the officers might be elected by the ratepayers?—Yes.

16,607. One-third of them must go out every year, and appeal to the ratepayers again for re-election, so that the whole local government of the place would be regulated by direct appeal to the ratepayers, year after year?—Yes.

16,608. Your government goes on without any appeal at all to the ratepayers?—Yes, and I am sorry for it. I wish to say, in connexion with the suggestion I have made, that I believe one of the most powerful means of relieving the present foul conditions of rivers would be to employ a system of disinfection habitually, because the deposit as it would reach the rivers would be accompanied by the disinfectant, and so long as the present system prevails of pouring the sewage into rivers I hold that an offensive and injurious deposit will take place there, and ought to be disinfected by some means until a better system is provided.

16,609. But it would be one of the most costly and inefficient methods that could be adopted. In Leamington they put up at great cost tanks to receive their sewage, and they were indicted for a nuisance below; they used disinfectants to the extent of 3*l.* sterling, day by day, but they were still liable to prosecution, and the nuisance was not abated?—Probably they attempted to convert the refuse into manure.

16,610. No; they simply attempted to make the effluent water from the tanks innoxious. In Cheltenham they used the most powerful disinfectants, with a like result?—I do not doubt the benefit of applying sewage to land, but I think if sewage was conveyed to the rivers disinfected the result would be what I have mentioned.

16,611. The land is the only true disinfectant?—I think it will be a very long time before that plan is adopted, because improvements go on so slowly.

16,612. Have you anything further to add?—Yes. I have observed a deposit in the water in this town; the water I think would be improved by filtration.

16,613. But that water is drawn from a well, is it not?—Yes, but there is a deposit frequently.

16,614. Of what character is that deposit?—It is a mineral deposit.

16,615. Is it in the shape of carbonate of lime?—It is principally lime.

16,616. Does that deposit take place when the water is exposed to the open air?—Yes, and sometimes it is considerable.

16,617. (*Professor Way.*) Is the water clear?—No, it is not perfectly clear.

16,618. You mean that there is a sediment?—Yes.

16,619. Not in chemical solution?—No.

16,620. (*Chairman.*) That is a matter to be dealt with by the persons supplying the water?—Yes. I should have been happy to have added something, but I will not detain the Commissioners any longer.

16,621. Be good enough to give us any information that you wish to lay before us?—I have here a copy of a letter from a surgeon in Keswick, and of disinfection he says that when small-pox prevailed to a great extent, he succeeded entirely by the use of disinfectants in abating the epidemic.

16,622. What is the name of the surgeon?—Dr. Leitch. I do not wish people to rely upon disinfectants, but I think they are valuable agents, especially during the prevalence of epidemics, and hitherto I believe the public have not had a tithe of the benefit they might have had from their use; it is too often forgotten that in removing night soil without previous disinfection most injurious gases are liberated, and these frequently play an important part in the production of epidemics.

16,623. Where you have no other means of removing filth?—Yes.

16,624. If you had a dirty floor you might make it less injurious to your health by sprinkling lime over it, but a brush and a mop and water would answer the purpose a great deal better, remove the dirt and you would not require a disinfectant.

16,625. (*Mr. Harrison.*) I presume you consider that prevention is better than cure?—Certainly; that is the whole ground of my advocating disinfectants; they are means of prevention.

16,626. If you prevented disease by a thorough system of sewerage, and by applying the sewage to land, which you can do here with facility, you would have no occasion to seek for a remedy to the disease?—When you can succeed in carrying that system out I admit it will be the very best thing; but I do not think that it will be done until it is enforced.

The witness withdrew.

The following note was added by the witness to his evidence:—

I think it would be a great blessing to the people here if the Government were to order an independent and rigid inquiry into all the causes of the present very high rate of mortality, as there appears to be no prospect of the matter being properly attended to without such an inquiry take place.

H. Muscroft, Esq., L.R.C.P.

HENRY MUSCROFT, Esq., L.R.C.P., of London (Pontefract), examined.

16,627. (*Chairman.*) I believe you are a surgeon practising in Pontefract?—Yes.

16,628. Are you the sanitary medical officer of the town?—Yes.

16,629. Appointed by the corporation?—Yes.

16,630. Can you tell us what the death rate in Pontefract has been for some years past?—The death rate at Pontefract for the last five years, calculating from the 1st of August in one year to the 31st July in the next year has been, between 1861 and 1862, 14·8 per 1,000; between 1862 and 1863, 17·09; between 1863 and 1864, 23·38; between 1864 and 1865, 24·67; and between 1865 and 1866, 29·1.

16,631. That shows a very rapidly increasing death rate in the borough of Pontefract?—It does.

16,632. Is that in the municipal borough?—Yes; it includes Pontefract, Tanshelf, and Monk Hill.

16,633. How do you account for that strikingly increasing death rate in the borough of Pontefract?—In a great measure by the imperfection of our sewerage arrangements and deficiency of water supply. Seven or eight years ago, when the modern improvement of waterclosets was more generally adopted, their contents entered into the drains of the town. Now we have an extremely small supply of water, and the consequence is that in dry weather all the drains of the town are little better than cesspools. There is a very imperfect system of trapping, and the wind, when it is in a certain direction, causes a stench to arise.

16,634. When was the sewerage carried out?—I think in the year 1854, before I was in practice here.

16,635. The water supply was obtained some years before that, was it not?—I believe shortly before that.

16,636. In what year was the water company established?—About 14 years ago.

16,637. Then the so-called improvements up to this time you consider have really been no improvements at all, but the contrary?—Yes.

16,638. To those so-called improvements being badly carried out you attribute the increasing death rate in Pontefract?—I do not say that they are the sole cause, but at all events they are one cause.

16,639. What other causes are there?—The death rate of last year, 29 per 1,000, appears to be a very high one, but little more than a year ago the union was established here, and so a number of old people were brought in from the country, and those old people dying, as they naturally would do, have rather in-

creased our death rate, but only in the proportion that I have calculated it. I find that last year out of 181 deaths eight were those of persons who had come to the town a few months before, but still the death rate is a remarkably high rate.

16,640. Did you hear what was said by the last witness as to the difficulty arising from their being two authorities in the town, and as to the advisability of having one responsible and concentrated authority?—Yes.

16,641. Does that alteration strike you as being necessary?—Yes, very necessary, I may say almost absolutely so.

16,642. Otherwise I suppose you will go on as heretofore, and instead of improving the health of the town you will be rather increasing the death rate?—Yes; the death rate in five years has almost doubled.

16,643. Are you in practice in Knottingley?—No, I am not; I have very little practice there.

16,644. You are aware, I presume, that the sewage of Pontefract passes now into the canal?—Yes, at Ferry Bridge.

16,645. And that the inhabitants of Knottingley use that water for domestic purposes?—Yes, they do.

16,646. Is not that a very objectionable state of things?—Yes, very reprehensible.

16,647. In both ways, as a duty to their neighbours and to themselves, it appears incumbent upon the inhabitants of Pontefract to take some steps to remedy the mischiefs which exist, does it not?—Yes, it does.

16,648. Is there any other point that you wish to mention?—I may mention that the water, from an analysis we have made this week, appears to contain nitrates. It is possible that this may arise from some imperfection in the construction of the pipes, because, when samples of the same water sent by me direct from the springs have been analyzed, a more favourable account has been given. Analysis, however, has not been made for salts of ammonia, and if any exist in the water at the spring, their complete oxidation, (*i.e.*, conversion into nitrates) may take place in the pipes under the influence of the air held in sollution, and perhaps even more especially by the recognized action of iron upon such oxidizable states of organic matter. The water is taken from a spring about half a mile off, in Tanshelf.

16,649. There are some wells in the town, I believe?—Yes, private wells.

16,650. Have you known in any case the water in those wells to be objectionable?—Yes; it has been decidedly impure near the mill dam at the other end of the town; it is very impure at certain times of the year—in summer.

16,651. When that is the case do you take any steps to prevent that water being used?—We have done so in this particular case, when we noticed its bad condition. I do not know that any special steps were taken. You must know that the water supply for Pontefract is the town's water; there are very few private wells; this is an exceptional case.

16,652. (*Professor Way.*) The well is about 45 feet deep, is it not?—I believe it is 50 feet deep.

16,653. It is not impossible, is it, that drainage from cesspools might get into it?—It is a porous soil, that is the only chance. I may say that we are in the midst of inquiry upon this subject. It was only three days ago that I knew of the fact I have just mentioned. I was astonished to hear that the water was so impure. When the water is taken directly from the springs before it comes into the town the same analyser tells me that it is comparatively free from nitrates.

16,654. There may be some leakage into the well?—Yes, there may be.

The witness withdrew.

Mr. William Brooke (Water Fryston) examined.

16,655. (*Mr. Harrison.*) Do you reside in this neighbourhood?—Yes, at Water Fryston.

16,656. Do you farm land in that neighbourhood?—Yes, 300 acres of land, under Lord Houghton.

16,657. Does any of that land join the river Aire?—Yes, a good portion of it.

16,658. What may be the value of the best part of that land?—3*l.* an acre is the rent for it.

16,659. Do the cattle upon that land drink the water of the river?—Yes.

16,660. Is that the only water which they can obtain?—Yes.

16,661. What may be the produce of that land annually per acre to you as a farmer grazing it with cattle?—We reckon that it will feed at the rate of a bullock an acre.

16,662. And that bullock during the 12 months will give you a return of how many pounds upon the average?—It depends upon circumstances, but perhaps 4*l.*

16,663. We have had it mentioned to us that a short distance below Leeds the water of the Aire is not suitable for cattle to drink, and that in fact they will not drink it. Supposing the water of the Aire to be reduced to that condition adjoining your land so that cattle could not drink it, to what extent would the value of that land be reduced to you as a farmer?—I should say that if cattle would not drink the water the land would only be worth 2*l.* an acre instead of 3*l.* an acre, because we should be forced to pasture it with sheep, but the sort of grass which grows there is not proper for sheep; it is too coarse for them, and they would not do so well upon it as bullocks would if the bullocks got plenty of good water.

16,664. Do you find that that grass is suitable for cattle after a flood, such as has just occurred?—I do not think that the flood will do any harm.

16,665. Does it improve the grass?—Yes; next summer the land will get dried, and the grass will spring through the surface, and I fancy that the land will grow a better crop.

16,666. Do you find it necessary to be cautious after such a flood as this in turning the cattle in the spring on to such grass as that?—Yes.

16,667. Does it produce irritation and scouring in cattle?—Yes; we let them go into the meadow for a short time and then take them out.

16,668. Have you observed ill effects of that kind increasing of late years?—No, I cannot say that I have.

16,669. Are there many people residing within your district at or near the river Aire?—There are a few cottages.

16,670. Where do the inhabitants of those houses get their supply of water?—From the river.

16,671. And they drink that water?—Yes.

16,672. Do you consider that it is suitable for drinking purposes?—They can get no other; they put it in pots and pans and let it remain for two or three days to settle, and then they drink it.

16,673. After it has settled is the water discoloured?—It is not perfectly clear, but it is pretty well clear.

16,674. And they are obliged to drink it?—They have nothing else.

16,675. If the river goes on being polluted in the same degree as it has been, do you think that they will be able to go on drinking the water of it?—I do not know; they drink it at present.

16,676. How many acres of the 300 which you occupy were covered with water in the last flood?—Perhaps about 50.

16,677. Have you any notion of the area of land which has been flooded by the late flood between Castleford and the junction of the Aire with the Ouse?—No.

16,678. What height was the water upon your land?—In some places it was two yards deep.

16,679. How much would that be over the bank

PONTEFRACT.

Mr. W. Brooke.

1 Dec. 1866.

which exists between your land and the river?—I should think that it would be one yard above the bank.

16,680. Then do you think that by raising that bank four feet higher the flooding of your land might have been prevented?—In ordinary floods the bank which we have would turn the water, but that was not the case in the last flood.

16,681. If the bank were raised about four or five feet higher than it is now would it prevent the flooding of that land?—It might, but the water got to such a height this time that no ordinary bank could withstand it.

16,682. Would it be an advantage to your land if there were a bank high enough to prevent floods, and if means were provided at the same time to let the water pass from the river over your land, under control, for the purpose of irrigating it?—You could not do it. If we had to raise our bank it would throw the water to the other side of the river.

16,683. It must be raised on both sides if it is raised on either?—Yes; on one side we have a bank, but on the other side they have none.

16,684. Are they more subject to flooding than you are?—Yes.

16,685. Do you find the floods come down more or less frequently than they used to do?—We have not had any flood of importance for some time except the recent flood.

16,686. Do you find any disagreeable smells from the river in a hot summer, such as the summers of 1864 and 1865?—Yes, the river is very offensive in hot weather.

16,687. It causes discomfort. Do you know any case of its causing ill health?—I cannot say.

The witness withdrew.

Mr. W. Worfolk.

Mr. William Worfolk (Knottingley) examined.

16,688. (*Chairman.*) Where do you reside?—At Knottingley.

16,689. What business do you carry on?—Shipbuilding.

16,690. How long have you resided there?—With the exception of about two years ever since 1824.

16,691. You have known the river, then, since that period, more or less?—I have known it all my life.

16,692. Upon what river are you situated?—The Aire and Calder.

16,693. Is it worse now than when you first knew it?—Considerably.

16,694. Is it offensive to your business in summer?—Not to my business.

16,695. I mean to your workmen individually?—It is not injurious to our working, because a vessel will swim in muddy water.

16,696. Is it offensive to your nose?—I cannot say that it is, but it is not fit for domestic use.

16,697. Used it to be so?—Yes, perfectly.

16,698. Up to what time did you use it for domestic purposes?—They use it now.

16,699. Bad as it is?—Yes.

16,700. Does it ever affect the people in any injurious way?—We are very often afflicted with diarrhœa and cholera. In 1832 Knottingley was probably one of the worst punished places in the kingdom, and in 1848 or 1849 we had the cholera, but not so bad as in 1832.

16,701. Have you had any cases of it this summer?—We have had several cases.

16,702. Do the drains from Pontefract annoy you?—They run into the stream the same as all other foul water.

16,703. Into the Goole canal?—Yes; formerly the drain from Pontefract went under the Goole canal with a culvert and emptied itself into the old river; but perhaps 30 years since, or before then, the culvert blew up, and since then it has emptied itself into the Goole canal.

16,704. The culvert has never been restored?—It has never been restored.

16,705. What is the population of Knottingley?—I cannot speak to the exact number, but it is nearly 5,000.

16,706. You have adopted the Local Government Act, have you not?—We have done so. We adopted it about four years since, but we have never carried it out.

16,707. You have not appointed a local board?—No; that was the only thing in which we were deficient.

16,708. You have adopted it to keep the Highway Act from coming in?—Yes; I have always been of opinion that the Local Government Act would be a beneficial thing for us, and I have stood it out to a great extent.

16,709. But you have never appointed a surveyor, nor elected a local board, nor done anything?—We have done nothing whatever. It has cost me a good sum of money to try to carry the Act out, but some of our gentlemen have another and a selfish motive. They calculated that the effect of the Local Government Act would be that the land, and the navigation, and the railway would be able to claim a reduction of three-fourths of the highway rates; they therefore considered that they would be losing by the Local Government Act, and in the very last session of Parliament they succeeded in getting a clause put into a bill to rescind the adoption of the Local Government Act.

16,710. So that you are now without it?—Yes.

16,711. It just fenced off the adoption of the Highway Act?—Yes.

16,712. You therefore adopted the Local Government Act, but have done nothing since under it?—Just so.

16,713. (*Mr. Harrison.*) Are you not now liable to be included in the Highway Act?—Decidedly.

16,714. So that you have had all your trouble for nothing?—Yes, and rather worse. My opinion is still that no government would be so good for us as the Local Government Act. With regard to the Pontefract drainage, when they made the main sewer they made some cesspools, but those cesspools are now of no use, for this reason, they are, I believe, full of sediment, and they have not been cleaned out for two or three years, and therefore the whole of the sediment of Pontefract comes down in the water to Knottingley.

16,715. (*Chairman.*) They choose to retain this refuse here until it stinks and sets up a putrid action and becomes a worse nuisance, whereas if they had no cesspool at all and let you get it day by day you would only have the whole of it as you have now, but you would have it much less offensively?—Just so.

16,716. Do you think that there is any chance of the people in this locality learning good practical common sense;—I think not. I think that they will learn selfishness.

16,717. What is to become of them if they will not learn that neglect produces disease, and destroys the working man's life. I suppose you know that the health of a working man is his property?—Of course.

16,718. And that in order to keep that which is his property in the best possible state for earning his livelihood he must have the means of health?—Yes.

16,719. And that if he is compelled to drink dirty water, to breathe foul air, and to suffer other inconveniences, he goes prematurely to his grave, and perhaps his wife and his children become paupers, if they do not die also?—Of course. In my opinion the water of the river ought if possible to be prohibited for domestic use.

16,720. You think that the Government should step in in some way or other to protect people from their own folly?—I think that people should make an effort to do it themselves.

16,721. And you think that there should be some power to prevent the people using the river in its

present polluted form and to find them better water?—Of course; many of our inhabitants have no pumps or wells, but fetch the water from the river and canal for every purpose for which they require it. Originally the river water was considered the best water which was to be had. I have known some old people go half a mile for the river water to make tea with, as it was good soft water; but now, if a vessel lies in our canal for a fortnight or three weeks I can scrape slime off it, slime completely full of little red worms, and if you put a rope into the water and let it remain for two or three weeks you can strike the stuff off, the stuff is all alive. Thirty years since I could see, on a fine summer's day, thousands of fish on the top of the water in certain places, but we now scarcely ever see a fish; I would also observe that the banks of the river are too low. We have been tremendously flooded by the last flood. Our gasworks have been flooded to the extent of seven or eight feet deep, and we were seven nights in darkness for want of gas.

16,722. Do you think that the last flood was as great as any flood which you remember?—It was rather larger.

16,723. Have you any bench marks of former floods about your place?—Yes, within a short distance of the place where I reside.

16,724. How high did the last flood rise in vertical height from the summer level?—It depends upon the part of the town where you take the measurement; the water rises a good deal more below the dam than above the dam; about midway between the two dams I should think that the water would have risen about 12 feet.

16,725. Then the persons who gave us evidence at the commencement of our inquiry that the floods were less now than they used to oe, and that they never expected to have any more floods, have been very much deceived?—I believe that this last flood has been about three inches higher than any man ever knew a flood here before.

16,726. Have you any record in your premises of a flood which took place in 1775?—We have no record of it; you are alluding to the Leeds bridge. There seems to have been such a flood. We learn that that flood occurred at the breaking up of a frost, and the bridge archways were blocked up with ice, which accounts for the water flowing so much higher above the bridge than it did below the bridge at that time.

16,727. The waterway was blocked up with ice, and therefore the height of the water at the bridge is no test of the actual height of the flood?—No test at all.

16,728. And this last flood you think may even have been higher than the flood in 1775 was?—I believe that it has been so in most parts.

16,729. You are aware that it has done a great deal of damage on the banks of the river and on the river itself all the way up?—Yes.

16,730. To the extent of many thousands of pounds?—I can only judge of it by what I read; it has floated vessels into fields.

16,731. Where has that been the case?—About Bottomboat; some vessels have been floated a considerable distance, and some just over the bank.

16,732. How much water will your lighters draw?—About two to three feet.

16,733. Then even a loaded vessel would have gone over?—No.

16,734. It would have knocked down the bank?—Yes.

16,735. If you had had a vessel of 100 tons with 30 or 40 tons in her, do you think that one of those river banks would have stopped her?—I think so, they are a good width.

16,736. They are about a yard wide on the top?—Yes, but they have a good bottom. At Bottomboat I believe that eight or ten vessels have floated into a field.

16,737. The people had to put ways under them and to launch them back again?—Yes. I should think that we have had from 100 to 200 houses at our place all flooded, and during the inundation the people had to be supplied with their necessaries, coals or bread or water, by boat; we had to boat about and to see who was in want.

16,738. That was also the case in Leeds?—Yes, but it was carried on with us for some days.

16,739. When did the flood rise to its greatest height with you?—On the Saturday afternoon, the 17th of November.

16,740. At what time?—I should think that it was at its highest about 1 or 2 o'clock; it fell a little towards night, and then it rose again.

16,741. Did it rise to its original height?—Not quite, but very nearly so.

16,742. Did it rain very heavily with you?—Tremendously.

16,743. For how long?—The whole of the Friday.

16,744. It began on the Thursday night?—Yes, and it rained right away to some time on the Friday night.

16,745. Did it rain on the Saturday?—I think not.

16,746. Have you ever floods rising with you when you have no rain at all?—Yes.

16,747. The water comes down from the upper hills and you have fine weather?—Yes.

16,748. What height will those floods rise?—They will rise to various heights; they will sometimes rise within a few inches of what the recent flood has been when we have had no rain.

16,749. Is there anything which you wish to add to your evidence?—In our place we are greatly punished in respect of drainage; we have no proper drains at all; there is scarcely a drain in the town where you can get a shovel to clean it out.

16,750. I suppose that you have discussed that subject with the parties there and that they will not do the work?—No. We have a surveyor for one year, and at the end of the year we change him and have some one else, and he says, "I must be as careful of "the money as I can, and show as good an account as "my predecessor."

The witness withdrew.

Adjourned *sine die*.

Subsequently to the inquiry at Pontefract the Commissioners received the following letter:

To the Royal Commissioners for inquiring into the best means of remedying the Pollution of Rivers, 2, Victoria Street, Westminster, S.W.

Ledsham Vicarage,
South Milford, Yorkshire,
December 4th, 1866.

GENTLEMEN,

IN the porch of the parish church of Ferry Fryston, situate about 200 yards from the bed of the river Aire, there is an old chisel mark, showing the height which the water reached in the great flood of the year 1775. From the character of the figures, and the tradition that confirms them, there is every reason to believe that this mark was made at the time of the overflow, which it commemorates. As it is generally supposed that this is the highest flood hitherto known in the valley of the Aire, it is a matter of much interest to compare the height of the water then with that which it reached on the disastrous 17th of last November. I therefore measured the difference between

the old water mark of 1775 and the line which the recent flood has left recorded unmistakeably on the whitewash of the porch, and the result is that the flood of 1866 was 6½ inches higher than that of 1775. I noticed a peculiar slimy deposit on the flagged causeway leading to Ferry-Bridge which emitted a nauseaus smell, and required to be scraped off before it could be got rid of. I was informed that the water had risen 11 feet 6 inches during the course of Friday and Saturday the 16th and 17th of November. As the valley is wide at this point, there could not be a fairer place for measuring the intensity of a flood, the main characteristics of which appear to have been the suddenness with which it rose, and the rapidity with which it subsided.

My parish (Ledsham) is I cannot say washed, but polluted by two or three miles of this once beautiful stream, from which the cattle in the heat of summer have been seen to turn away with loathing, and from which every description of fish has gradually disappeared. In former times, they used to be found in quantities on the meadows when the water had subsided, but I cannot ascertain that one single fish has been seen after the deluge we have just experienced. Apart from the smell which it emits, the colour of the water is enough to set both man and beast against it. The river, in fact in its present state, is good for nothing but a boundary fence, and highway for barges. It contains hardly sewage enough for tillage, and considerably too much for any other purpose. It seems not a little hard, that we, who have no participation in the profits arising from its pollution, should have our river rendered thus useless and unpleasant. You will indeed confer a great boon upon us if you can do anything towards restoring it to that primitive state of purity which made it a favourite resort of salmon, and according to the old* distich insured the cleanliness of those Castleford damsels, who have now to avail themselves of a cheap train to Scarborough to perform even an annual ablution.

Your obedient servant,

(Signed) James J. B. Landon, M.A.,
Vicar of Ledsham, Yorkshire.

---

* "Castleford lasses must needs be fair,
For they wash both in Calder and Aire."
Or, according to the more elegant version of Lord Houghton,—
"Castleford lasses must needs be fair,
Washed in the Calder and bathed in the Aire."
N.B.—*Fair*, it should be here observed, has no reference to the personal attractions of the ladies in question, but merely means clean, in the way we use the term when we speak of a "fair linen cloth."

INDEX.

Evidence of, 8579–629.

ASHES:
Proportion of from coal, 4638–4641, 4821–2, 6884. Enormous reduction of, by proper consumption of smoke, 12,190. Useful for roads, 3124* and *passim*; useful, when ground, as a substitute for sand in the making of cement, 2936*, 4514, 4731–4736.
Carted away, 1350, 1638, 1858–1860, 1878–9, 3127–8, 3813–4, 4164–6, 4376–7, 4514, 4726, 5270–1, 6799, **6889**, 7192, 7647–52, 7870–1, 8038–42, 8519–20, 9140–4, 9296, 9924–6, 10,288–92, 10,380–2, **10,513–9**, **11,009–18**, 11,155–50, 11,224–6, 11,368–71, 11,604–6, 11,728–30, 11,832–4, 11,903–6, 12,090–3, 12,136–9, 12,201–2, **12,345**, **12,352–3**, 12,618–20, 12,965–9, 13,530–41, 14,339–40, 14,458, 14,486–8, 14,557–61, 14,818–9, 15,496–501, 15,974–6, 16,380–2.
Expense of removing, 1878–83, 6801, 6900–1, 8041, 11,018, 13,5379, 14,134, 14,155–60, 14,340.
Tipped into streams, 756–7, 1249–50, 1294, 1324–34, 2381, 3016*, **3210***, TABLE, 3399*–3401*, 3523–7, 4303–4, 4575, **4613**, 4823, 5017, 5501–4, 12,671–4, 12,682, 12,687–701, 12,746–7, 12,793–6, 12,802, 12,874–5, 13,632–8, 14,127–34.
Effect of ashes tipped into streams. The bed is raised, 693, 3366–92, 3197*–8, 3203*, 3302*, 3406*, 3529–31, 4386, 4520, 4549, **4616–7**, 4942, **5422** Paper, **5736–9**, 8641–8, 11,265, 12,802–4, 12,898–901, 12,942, 13,**156**, 13,467–8, 13,515–22, 13,541–6, 13,619, 13,690, 13,736, 13,827, 13,832, 13,898–909, 14,056–7, 14,122, 14.148–51, 14,515, 15,933. Banks become irregular, 3123*, 4942. Floods are caused or increased, 3048*, 3204*, 3303*, 3537–40, 5422 Paper, 12028–31, 12,634, 13,547–9, 13,599–614. Navigation is impeded, 1334. Drains are backed up, 13,157–8, **13,599–614**, 13,627, 13,814–9, 13,833–7, 13,923–40. Water-power is decreased, **11,942**, **12,602–16**, **14,099–100**. *Secus*, the raising of the bed is due not to ashes, but to mountain débris, 12,987–8, 14,160, 14,167, but see 13,159.
The throwing in of, prohibited under the Aire and Calder Navigation Acts: 1326–34, 1871–8, 2060, 6890, 7485; but the prohibition applies only to navigation channels, not to becks, 2066–7, 7328–32, 7477–8.
Legislature should prohibit throwing of ashes into any running stream, 3391–2, 3019*, 3528, **6893–8**, 9302, **10,519–23**, **11,092**, 11,455, 11,710, 12,117, 12,622–3.

ASH-PITS, see *Privies.*

ATKINSON, Mr. (of Pontefract)
Evidence of, 16,574–626.

AUTY, Mr. E. (Messrs. J. Howgate and Sons, of Mirfield):
Evidence of, 2585–675.

B.

BAILEY, Mr. (of Skipton):
Evidence of, 15,065-89.

BAMFORD, Mr. (of Todmorden):
Evidence of, 13,046-92.

BARKER, Mr. J. (of Wakefield):
Evidence of, 1335–444.

BARTHOLOMEW, Mr. (of Leeds, Engineer to Aire and Calder Navigation):
Evidence of, 7300–468.

BATES, Mr. J. (of Dewsbury):
Evidence of, 2824–99.

BATLEY, *see* evidence of chairman of local board, 2363–2481; of late surveyor and inspector of nuisances, 2312–62; of Mr. Marriott, cotton merchant, 2482–560. Population, 2368. Rateable value, 2398. Area, 2430. Sewerage partial, 2316. Sewers not ventilated, 2324–6. Sewage passes into beck, 2316–21; 2387. Ashpits, 2328–38.

BEAUMONT, Mr. (of Elland):
Evidence of, 12,580–95.

BEHRENS, Mr. (of Bradford):
Statistics put in by, 10,808–9.

BINGLEY, *see* Evidence of Mr. Dryden, Improvement Commissioner, 13,452–522; of Mr. Sugden, worsted spinner, 14,516–596. Population 13,454; rateable value 14,350; local government 13,453–62; sewage of, goes into Aire, 13,471, 14,352–4, 14,364; waterclosets exceptional, 13,475–8; Water Supply, 14,348.

BLACKBURN, Mr. (of Brighouse):
Letter from, 5422.

BLAMIRES Mr. (of Bradford):
Evidence of, 10,232–61.

BOOTH, Mr. (of Halifax):
Evidence of, 13,150–294.

BOWDITCH, Rev. Mr. (of Wakefield):
Evidence of, 2199–2201.

BRACKEN, Mr. (of Luddenden):
Evidence of, 12,249–90.

[*Numbers* 2919–3467 *are repeated in the Evidence: when the reference is made to the numbers as used the second time, the numbers are distinguished by an asterisk.*]

BRADFORD:
Witnesses examined:
The Mayor 8630–58.
President of Chamber of Commerce, 10,435–639.
Town clerk, 8728–827.
Borough engineer, 8828–9109, 9913–5.
Manager of gasworks, 9350–462.
Mr. Jeffery, solicitor to the prosecutors of Canal Company, 9684–709.
„ Mumford, solicitor to Bradford Canal Company, 10,640–54.
„ Crowther, lessee of Bradford canal, 10,653–10,708.
„ Constable, solicitor to Mr. Stansfield, owner of Esholt Hall, 9617–83.
„ Riley, gardener at Esholt Hall, 9560–616.
„ Holmes, gamekeeper at Esholt Hall, 9505–59.
„ Godwin, stuff merchant, 8659–727.
„ Mitchell, stuff merchant, 9463–504.
„ Ingham, dyer, 9110–9251.
„ Samuel Smith, dyer, 9252–349, 10,709–749.
„ Sutcliffe, mill-owner, 9916–81.
„ F. W. Anderton, worsted spinner, 10,262–322.
„ Illingworth, spinner, 10,373–434.
„ J. W. Leather, civil engineer, 9982–10,231.
„ Blamires, soap manufacturer, 10,232–61.
„ Thompson, soap manufacturer, 9768–862.
„ Hamilton, grease manufacturer, 10,323–72.
„ Salmond, soap manufacturer, 10,750–94.
„ Slee, tanner, 9710–67.
„ Leather, vitriol maker, 9862–912.
„ France, accountant, 10,795–808.
Area 8832–3, 8906. Rateable value, 8746, 8835–6. Population, 8664, 8717, 8745, 8834. Trade, *see* evidence of Mr. Ripley, **10,435–654**, especially 10,567–72. Local Acts, 8734–40. Water Supply, 8866–99, 8915–31, and see *Water Supply*. Gasworks, 9350–462. Sewerage 8859–61, 8945–64; 8972–83, and see *Sewerage*. Sewage passes into beck, 8654, see *Sewage*. Privies, 8846–56. Waterclosets, 8845. Mortality, 8965–70. Beck receives the whole sewage of town, 7296–7, 8433–5, 8654, 8912, 9668; is encroached on by buildings 8903, 8907, 8912. Canal, fed by beck and very foul; closed by an injunction, and about to be sold, 8543, 8700, **8913–5**, 9226–36, and see Evidence of Mr. Crowther 10,655–708; of Mr. Mumford 10,640–54; of Mr. Jeffery, 9684–9709.

BRADLEY, Mr. W. (of Skipton):
Evidence of, 14,864–922.

BRADLEY, Mr. B. H. (of Skipton):
Evidence of, 15,120–204.

BRAMLEY:
Unsewered and unhealthy, 6382–9.

BRAYSHAW, Mr. (of Bradford):
Evidence of, 8630–658.

BRIGHOUSE:
Letter from Mr. Blackburn of, 13,092–3.

BRIGG, Mr. (of Keighley):
Evidence of, 13,981–14,108.

BROOK, Mr. John (of Huddersfield, registrar):
Evidence of, 2979*–3103.*

BROOKE, Mr. E. (of Huddersfield, earthenware tube manufacturer):
Evidence of, 3994–4071, 4785–4815.

BROOKE, Mr. H. (of Huddersfield, woollen manufacturer):
Evidence of, 3504–674.

BROOKE, Mr. T. (of Huddersfield, mill-owner):
Evidence of, 4816–969.

BROOKE, Mr. (of Water Fryston):
Evidence of, 16,655–87.

BUCKLEY, Mr. (of Todmorden):
Evidence of, 12,656–74.

BURGESS, Mr. (of Huddersfield):
Evidence of, 4970–5003.

BURR, Mr. (of Keighley):
Evidence of, 13,370–451.

C.

CALDER, see *Dewsbury, Halifax, Huddersfield, Todmorden, Wakefield.* Area and population of Valley, **118–119** TABLES: **10,231** TABLE No. 4.

CALVERT, Mr. (of Skipton.)
Evidence of, 14,923–15,008, 15,295–308.

CANAL, *see* evidence of Mr. Greenwood, Inspector of Canals at Huddersfield, 3272*–3336*; and *Aire and Calder Navigation.* Bradford; fed by beck, and very foul; about to be closed, as a nuisance, under an injunction, 8543,8700, **8913–5**, 9226–36; and *see* evidence of Mr. Crowther, 10,655–708; of Mr. Mumford, 10,640–54; of Mr. Jeffery, 9684–709. Canals, holding stagnant water, supplied from the rivers, become worse than the rivers, 3268*, 3272* Paper; 3287*, 3288, 4116, 8700, 8702, **8913**, 10,656–82, 11,473, 11,482–3, 11,928. Canals sometimes used as Water Supply, 3322*–36*, 3556–60, 7359–66, 14,344–5.

CANAL ASSOCIATION, Letter from, **8629–30.**

CARBIDE, filtration by, *see* evidence of Mr. Spencer, 1714–1837, 1982–2051, and *Water Supply* (Wakefield.) Cost of, to Leeds would be 20,000*l.*, 5927.

CARCASES, floating in river. See *Scavenging.*

CARTER, Mr. (of Knottingley):
Evidence of, 16,518–54.

CARTER, Mr. Alderman, of Leeds, 7000–161.

CASTLEFORD:
Witnesses examined:
Dr. Simpson, Officer of Health, 16,280–371, 16,572–3.
Mr. Jessop, surgeon, 16,200–32.
„ Wilkinson, agent to Aire and Calder Navigation Company, 16,121–99.
„ Horn, flint grinder, 15,468–570.
„ Simpson, glass bottle manufacturer, 16,372–427.
„ Hunt, manufacturing chemist, 16,428–83.
„ Heptinstall, corn miller and maltster, 15,968–16,120, 16,283–79.
„ Wilson, manager of gasworks, 16,484–517.
Population, 15,979, 16,113–5. LocalGovernment, 15,981–4. Mortality, 16,116, 16,342, 16,350, 16573. Sewerage very partial, sewers not ventilated, 16,227–30, 16,250–3, 16,233–79; sewer mouths not protected, 16,254–8; some sewers are open, 16,260. Sewage from sewers passes into river, 15,502–4, 15,986. Sewers are sometimes back-watered by floods into cottages, 16,239–44, 16,271–9, see *Sewerage*, *Sewage*. Waterclosets, nine in number, 15,988. Privies, 16,074–9, 16,293–309. See *Privies*. Water Supply, 16,063–7, 16,212–7, 16,285–91, 16,343 Paper; 16,351–4, 16,357–60, and see *Water Supply*. Gasworks, 16,484–98.

CATTLE suffer from polluted water, 1282, 3194*–5,* 5572–9, 5584, 5621–5, 5761–6, 8259, and *see* evidence of Mr. Mitchell, 7665–7732.

CHADWICK, Dr. (of Leeds):
Evidence of, 6660–776.

CHAMBERS, Mr. (of Todmorden):
Evidence of, 12,740–71.

CHARLESWORTH, Mr. (of Thornhill):
Evidence of, 3041–104.

CHEMICALS. *See* evidence of Mr. Leather, of Bradford, 9862–915; of Mr. Hunt, of Castleford, 16,428–16,483; of Mr. Holliday, of Huddersfield, 3904–93; of Mr. Hick, of Wakefield, 1926–81. Used in copperas manufacture, 1926–81; in dyeworks, 9158, 11,638, 12,087, **12,340**; in wireworks, 11,344; in paper manufacture, 12,057, 12,265; in tanning, 6450–1 Table. Chemical works at Leeds, **6659–60**, TABLE. A nuisance to the rivers, 789–90, 1273–6, 3923–9, 6601–7, 11,950–6; should be excluded from the rivers, Letter of Canal Association, 8629–30.

CHILD, Mr. (of Halifax)
Evidence of, 11,825–95.

CHILDE, Mr. (of Wakefield):
Evidence of, 1690–714.

CHOLERA in Wakefield, 31, 2141, 2146, 2156–67, 2171–89, 2199–201; at Castleford, 16,351–354.

[*Numbers* 2919–3467 *are repeated in the Evidence: when the reference is made to the numbers as used the second time, the numbers are distinguished by an asterisk.*]

CLARKE, Mr. (of Skipton):
Evidence of, 15,309–33.

CLAY, Mr. D. (of Sowerby Bridge):
Evidence of, 12,196–12,248.

CLAY, Mr. (of Rastrick):
Evidence of, 11,720–11,824.

CLOUGH, Mr. (of Huddersfield):
Evidence of, 5319–86, 5401–2.

CLOUGH, Mr. (of Keighley):
Evidence of, 14,365–454.

COCKSHOTT, Mr. W. (of Keighley):
Evidence of, 13,615–677.

COCOA-NUT FIBRE MANUFACTURE. *See* evidence of Mr. Perkin, 1544–1616; a pollution to the Calder at Wakefield, 103–5, 472–4, 2149; one firm restrained by injunction, 543–4 Paper.

COLEMAN, Mr. (of Pontefract):
Evidence of, 15,571–15,633.

COLLIERIES:
Sometimes furnish Water Supply, 10,471–6; sometimes diminish it, 16,508. Ochrey water from, see *Ochrey*.

COLNE, RIVER. *See* **3210–1 TABLE**, and generally evidence taken at Huddersfield, 2919*–5422.

CONSERVANCY, RIVER:
Necessary, to prevent pollution, 2063–4, 1490; to prevent casting in of solids, 7493, 12,018, 12,512, 12,622–3, 13,324, 13,640; to prevent encroachments, 5422 Paper, 14,779, 12,712–3; to establish protection against floodings, 12,757, 12,865–70, 12,989, 13,032.
There must be local boards to maintain a local supervision, 5088–92, 4954–5, 8799, 3575–6, 4256–9.
There must be a central authority to see that local boards do their duty to those situated lower down on the river; its jurisdiction must extend over entire length of river, and over tributaries as well as main stream, in short, over watershed, 2081, 2754, 2914, 3575–6, 4256–9, 6941, 8649–52, 11,866, 11,245–51.
Suggestions for constitution of local board:
α. The Board of Health, or ordinary local government, 5401.
β. A board consisting of persons most interested, as manufacturers, managers of water companies, borough surveyors, &c., to be elected in district, 4221–2, 4954–5, 5088–92, 5112, 5387–5400; or nominated by magistrates.
γ. An independent power appointed by central government, 67–9, 1490, 2064, 2086–9, 2119–23, 2969, 4695–700, 5506–9, 5568, 10,111–12, 13,331–3, 15,253–9, 15,730, 15,735–49.
Suggestions for constitution of central authority:
α. A board consisting of persons most interested, elected from the whole watershed, 4, 10,929–44, 10,985–91.
β. A department of supreme government, 3575–6, 11,245–51.
γ. Inspectors (like Factory Act Inspectors) appointed by supreme government, and independent therefore of local board, 2477, 2971, 4281, 4954–5, 5093, 5391, 8799, 13,330–6, Letter 13,092–3.
Assistance should be given by magistrates, 2081, 4264, 13,337–48; by borough and county police, 2074–7, 2105–6, 2478–9, 13,337–48, 14,064–7. Any persons interested should have power to prosecute, and punishment should extend to persons causing offence to be done, **8628–30** Letter. Manufacturers, members of local boards, ought not to vote on matters in which they are interested, 5401. Provisions of Highway Act might be imitated, 5411.
Expense of, to be borne by county rate, 2107–9, 3372*–4, 3761, 4969; to be made on Poor Law valuation, and to be collected by overseers of poor when they collect the poor rate, **10,968–71**, 12,757–62, 12,781–5, **12,865**, **12,890–3**, 13,325–8.
See *Legislation*.

CONSTABLE, Mr. (of Otley):
Evidence of, 9617–83.

COOPER, Mr. (of Fartown, Huddersfield):
Evidence of, 4750–84.

COPPERAS (Manufacture): *see* Evidence of Mr. Hick, of Wakefield, 1926–81.

COTTON (Manufacture): *see* Evidence of Mr. Sidgwick, of Skipton, 14,667–724; of Mr. Marriott, 2482–2560.

CRAVEN, Mr. C. (of Keighley):
Evidence of, 13,728–820.

CRAVEN, Mr. Joseph (of Keighley):
Evidence of, 13,093–149.

CRONHELM, Mr. (of Halifax):
Evidence of, 11,896–985.

CROSLAND, Mr. (of Lockwood):
Evidence of, 4500–64.

CROSSLEY, Mr. (of Halifax):
Evidence of, 12,083–124.

CROSSLEY, Mr. (of Halifax):
Evidence of, 10,992–11,144.

CROWTHER, Mr. (of Bradford):
Evidence of, 10,655–708.

CROWTHER, Mr. (of Lockwood):
Evidence of, 4565–4705.

CRUTCHLEY, Mr. (of Wakefield)
Evidence of, 1096–1151.

D.

DARWIN, Mr. (of Otley):
Evidence of, 5580–5625.

DEBRIS: From mountains, chokes the streams, 3271*–2* Paper; 3318*, 12,699; how to be intercepted, **5731–34**, 12,814–7, 12,908–10, 12,978, 15,164–9, 15,272–6.

DENT, Mr. (of Wakefield):
Evidence of, 1838–1925.

DEWHURST, Mr. (of Skipton):
Evidence of, 14,800–63.

DEWSBURY:
Witnesses examined:
Mayor, 2676–2823.
Borough Surveyor, 2202–60,
Inspectors of Nuisances, 2261–2311.
Mr. Ridgway, 2561–84.
„ Bates, 2824–99.
„ Alderman Tweedale, 2900–18.
„ Maddison, 2930–3040.
Population, 2204–5. Area, 2222. Trade, 2206. Sewerage, 2208–21, see *Sewerage*. Sewage of sewers passes into rivers, 2209, see *Sewage*. Water Supply, 2223–7, 2250–2, see *Water Supply*. Privies, 2243–5, 2253–6, 2287–94, see *Privies*. Slaughterhouses 2302–11.

DIBB, Mr. (of Wakefield):
Evidence of, 146–51.

DIXON, Mr. (of Keighley):
Evidence of, 14,597–662.

DRAINAGE:
Its effect on health, volume of river, and value of land, **10,218–31** and see *Aire Dale Drainage*.

DREDGING:
See evidence of Mr. Bartholomew, engineer to Aire and Calder Navigation, 7300–468; of Mr. Holmes, 735–830; of Mr. G. Smith, 1222–334; of Mr. Oates, 3354–467; of Mr. Wilkinson, 16,121–99. Increasing extent and cost of, 740–7, 763–5, 1224–43, 1253, 7318–33, 7348. **7487–8** Tables; material dredged up, not sand but ashes and filth, 1249–50, 1294, 3220–2, 3293, 3393–3410, **16,174–6**, **16,189**. Occasionally done by manufacturers for themselves, 6928–31.

DRESSER, Mr. (of Headingley, Leeds):
Evidence of, 8080–231.

DRYDEN, Mr. (of Bingley):
Evidence of 13,452–522.

[*Numbers* 2919–3467 *are repeated in the Evidence; when the reference is made to the numbers as used the second time, the numbers are distinguished by an asterisk.*]

DYERS :
Witnesses examined :
At Bradford Mr Ingham, 9110–251.
„ Ripley, 10,435–639.

„ Goldthorpe, 1445–543.

DYES :
Kinds used, 1884–6, 2651–64, 3429*–33*. Amount used, 6789, 11,635, 12,086, 12,344, 14,825; altogether in the district perhaps 20,000 tons yearly, **10,545–52**. Process of using, 435, 10,478–9, 10,711, 14,825–63.

DYEING :
Extent of trade. *See* evidence of Mr. Ripley, **10,435–10,639**.

DYE WASTE, SOLID :
Is thrown into river, 2240, 2381–2, 2571–6, 2583, 6790, 7958, 9125–9, 12,218–20; to the great injury of the bed, 793–6; might be all kept out without hardship to manufactures, 1868, 2503–9, 2538–9, 2625–6, 2723, 2740. Its use for land may be questionable, 2713–21, 10,493; though it is occasionally bought by farmers, 8507–10; but chipped dyewoods are easily collected and burnt under boilers, 1437, 1590, 2601–2, 2722, 3036*, 3397*, 5291, 8511, 11,641, 11,993–9, 12,104, 14,810–2. Rasped dyewoods may be collected with a little trouble, and, though unfit for fuel, may be made into a spoil-heap, and so burnt, 6793, 6841–3, 7974–6, 9297, **10,495–10,505**, **11,099–11,106**, 11,643–5, 11,760–1, **12,024–6**.

DYE WASTE, LIQUID :
Volume of, 3638–43, 4290, 4579, 4889–93, 4903, 6782, **6806–7**, 6848–54, 8490–506, 9154–8, 9269–80, **12,336**, and *see* **3210–1** Table. Amount of dye in, **11,824** Letter. Cast into stream, table **3210–1**, and *passim*. Pollution from, see *Pollution*. Somewhat useful, however, as a deodorizer of sewage and other putrifying refuse, 11,701–3. Cannot be intercepted from streams, because foul water more valuable than none, 2699–700, 3171–7, 3242, 3581–3, 4240–1. Bad for purposes of irrigation, 2547, 5282–8. *Secus*, good for irrigation, 3567–8, 3658, **3696**, **3709–41**, **3769–77**, **3792**, **3820**, **3870**, 3877–83; but possibly good, because of admixture of soap, and might be injurious if soap were previously extracted, **3786–3807**; but certainly not injurious to land if run into sewers and mixed with sewage, 2820, 3807, 6830. Can with difficulty be partially purified by filtration, 1430–3, 2542–6, 2630, 3743–7, **3822–3863**, 10,507; also by settlement, 1900–3, 2446, 2628–9, **10,471**, 10,490–2, **10,729–31**, 11,183, 11,222; but settling reservoirs require space, and might become a nuisance, if the liquid waste contained oil and soap, 2701, 2710–3. Have manufactories usually space for treatment of waste products? 1438–42, 1537, 1907–12, 3131,2, 3611, 4343–7, 9148, 9201–4, 9216–24, 9322–5, 11,817. Whatever treatment is possible might, in many cases, be applied to the waste of several mills in combination, 2726–8, **3467** Paper; *Secus*, 10,491.

E.

EASTWOOD, Mr. (of Huddersfield) :
Evidence of, 3379*–3503.

ELLIS, Mr. (of Dewsbury) :
Evidence of, 2676–2823.

ELLISON, Mr. (of Knaresboro') :
Evidence of, 5771–87.

EMMOTT, Mr. (of Keighley) :
Evidence of, 13,895–974.

EXCAVATIONS :
Thrown into river, 2934*, 3122*–3*, 4085, 4408,9, 12,323, 12,764, **12,970–1**, 13,622, 13,831, 14,160; might be utilized for raising low levels, 3124*.

EXCREMENT :
Used in manufactures. Pigs' dung for cloth, 7587. Dogs' dung for leather, 7587–8, 7597–6000. Human ordure for cloth and tanning, 7590, 6581–6. Urine, 2447.

F.

FARRAR, Mr. G. (of Honley) :
Evidence of, 4286–4364.

Evidence of, 12,844–870.

FIELDEN, Mr. Joshua (of Todmorden) :
Evidence of, 12,786–843.

FIELDING, Mr. (of Sowerby Bridge) :
Evidence of, 11,986–12,031.

FIELDING, Mr. R. (of Todmorden) :
Evidence of, 12,675–12,701.

FILLITER, Mr. E. (of Leeds) :
Evidence of, 5788–6084.

FILTRATION :
Of water, by Carbide, *see* evidence of Mr. Spencer 1714–1837; Mr. Filliter, 5917–5930.
Of dye liquor, 1430–3, 2542–6, 2630, 3743–7, **3822–63**, 10,507.

FISH :
Formerly abundant in rivers, now almost extinguished, 4, 85–6 Paper, 106–9, 119, 130, 548–51, 673–6, 718, 827–30, 1277, 2280–2, 2380, 3066–8, 3156–7, 3307–12, 3451–2, 6469, 7736–66, 8319, 13,687, 16,041–6; and *see* evidence of Mr. Roodhouse of Wakefield. 1067–1095.

FLAX SPINNING :
See evidence of Mr. R. Tennant, of Leeds, 6864–6999.

FLOODINGS :
About the same as formerly, 704, 1381; fewer and not so severe, 12, 143–5, 1256–7, 3080, 3411–7, 3261*, 4871, 7405, 10,001. Causes assigned; equalization of flow by construction of reservoirs, 3081, 3424–5, 3264*–6*, 4871,2, 10,002, 14,012; and more rapid passing away of water in consequence of Aire Dale Drainage, 5770 Paper No. 1, 5717–30, 5745–7, 14,898–903, 15,037–52, 15,134–8, 15,156–63, 15,173–9, 15,928–30. *Secus*, greater than formerly, 13,263–4. Recorded heights of floods, 683–6, 770–7, 3411–21, 5755–9, **13,052–92**. Particulars as to great flood of November 1866; at Wakefield, 734; at Bradford, 10,187; at Todmorden, **12,653–5**, 12,702–8, 12,728–33; at Keighley, 13,301–3, 13,732–8, 13,819, 14,095–6, 14,152, 14,163, 14,358–64, 14,392–403, 14,550–5; at Castle-

[*Numbers* 2919–3467 *are repeated in the Evidence: when the reference is made to the numbers as used the second time, the nmmbers are distinguished by an asterisk.*]

Floodings—*cont.*
ford, 16,001–8, 16,137–43, 16,218–24; at Knottingley, 16,721–50.
(Preventible causes of):
Neglect of embankments, 3433–4, 12,712–3,**12,725–7**, 12,761–4, 12,780, 12,802, 12,946, 12,976.
Raising of bed by casting in ashes, 693, 3366–92, 3197*–8, 3203*, 3302*, 3406*, 3529–31, 4386, 4520, 4549, **4616–7**, 4942, 5422 Paper, 5736–9, 8641–8, 11,265. 12,802–4, 12,898–901, 12,942, **13,156–9**, 13,467–8, 13,515–22, 13,541–6, 13,619, 13,690, 13,736, 13,827, 13,832, 13,898–13,909, 14,056–7, 14,122, 14,148–51, 14,515, 15,933; by suffering accumulation of mountain débris, 12,987–8, 14,160, 14,167.
Improper drainage, 5515–5517, 5564, 7406. But see *Aire Dale Drainage.*
Raising of dams and cloughs, 6499–503, 12,924.
Insufficient water way, 12,780.
Permanent obstructions placed in waterway, 14,395, 402.
Diversion of stream from proper course, 12,803.
Neglect of land-owners to shut flaps of drains, 697–700, 3435–6.
Careless letting out of contents of reservoirs, 13,298.
Effects of, *see especially* evidence at Todmorden, 12,596–13,092.
On dwellings, at Todmorden, **13,014–26**, 13,642–4; at Keighley, 13,923–40, 13,968–70; at Castleford, 16,220–4; at Knottingley, 16,737.
On wells, 16,356.
On manufactories, 1383,4, 3048*–9*, 4348–50, **12, 754–6**, 12,945–7, **12,974–5, 12,991**, 13,550, 13,631, 14,173–4.
Gasworks at Knottingley suspended for a week, 16,721.
Effect of; on land, 3428–32, 5515, 12,702–12,708, **12,754**, 13,297, 13,311; on banks, 1258–60; on bed of river, 1264–70, 12,641–5, 13,027–9, 16,157–9.
Authority required to make proper provision against, 12,757, 12,865–70, 12,989, 13,032. The benefits of proper provision would be many times the value of the outlay, **12,754–6, 12,974–5, 12,991**.

Mr. Hamilton, 10,323–72.
Mr. Salmond, 10,750–94.
Mr. Thompson, 9768–862.
„ Huddersfield, Mr. Seed, 5114–51.
„ Keighley, Mr. Townend, 14,215–63.
„ Wakefield, Mr. Teall, 316–456,

Grease Extraction:
From waste soapsuds,
1. Process.
2. Result.
3. Extent of its application.
4. Causes of its limited application.

1. Process commenced 20 years ago; before that time the valuable grease was lost and polluted the river, 326. Process described, 320–3, 336–42, 431, 9814. Acid used as a precipitate, 5143–50; as little acid used as posible, 431, 9804–5; perhaps 15 lbs. of acid to 1,100 lbs. of water, 9795–800, 10,332–4. Two modes, one hot, which by use of steam extracts a larger quantity of grease in a shorter time, a patent process, 335, 5132–40; the other, the cold process, not patented, 3317. Process, if not properly attended to, may cause smell and nuisance, 404–7, 596, 6578. Some manufacturers operate on their own soapsuds, 411, 4191–4, 11,060, 14,220–36; others let out their soapsuds to contractors, and usually provide premises and steam, 347, 402. In some cases the contractor collects the soapsuds of several factories into premises of his own, and there operates upon them, 334, 1531–4. The contractor pays either a lump annual sum, or so much for the quantity of soap used at factory or recovered as finished grease, 347, 9218, 9838–9, 10,277, 10,317, 10,405–11.

2. Results, &c. Grease is recovered, convertible into stearine and cloth-oil worth from 18*l.* to 20*l.* per ton, 343, 394, 5120. Estimate of amount of soap used, 1356, 1511–2, 11,839, 12,101, **12,337**, 14,072, 14,216, 14,471. Proportion of soap to volume of water, **11,824** Letter; amount recovered perhaps 15 cwt. out of 12 packs of soap, each of 256 lbs., 10,351, 4915–31, 9842, 9851. Lump sums paid annually by contractors to manufacturers, from a few pounds up to 900*l.*, and in one case 3,000*l.*, 349, **411**, 439–41. Proportion paid upon soap consumed varies from $\frac{1}{30}$th up to $\frac{1}{2}$th, **4915–31**, 9218, 9838–9, 9842, 9851, 10,277, 10,317, 10,405–11, and the manufacturer provides premises and steam, 347, 402.
β. A residuum, bought by farmers as (not very valuable) manure; 344, 10,335, 10,359, 11,064–6.
γ. Indigo (when used) is recovered, 380–6, 420–5.
δ. Effluent water is much improved, 351, 378, 429, 9804; but still dirty, 2703–4, 5051–2, 7221, 9862. 10,341–2, 10,280, 14,500–1; is not bad for irrigation, 14,080–90; if subsequently filtered, becomes quite clear and fit for dyeing, 14,241–50, 14,304–7, 14,313–5.

3. Extent of application. Mr. Teall has 120 establishments, 352, and recovers weekly 50 tons of grease; other contractors recover 50 more, 391–2; altogether perhaps, 4,000*l.* worth of grease is obtained, 399. Instances where process is used, 1398, 2620, 2702, 3163, 5046–56, 2382, 7199–231, 9873, 10,275, 10,590, 11,060, 11,216, 11,381, 11,920, 12,223, 12,363, 14,218, 14,474.

4. Causes of its limited application: α. Many firms, for the sake of small profit, will not take trouble to work process or admit strangers on the premises for the purpose; in very few cases, where factories are very small, the process might not pay, 354–7, 363. The soapsuds of hundreds of small factories are yet untouched, 355–9; instances, 1454, 1509–10, 1906, 3764–6, 5273–8, 9205–13, 11,623, 11,747–8, 11,845–9, 12,102. No hardship to make process compulsory on all, at least wherever it would involve no loss, 365–7, 1402–5, 1522, 3168–9, 9214–5, 10,592–4, 14,304–5.

β. Profit comes only from operating upon richest part of soapsuds; Mr. Teall, when authorized to take all soapsuds, lets the thinner part pass, unoperated

[*Numbers* 2919–3467 *are repeated in the Evidence: when the reference is made to the numbers as used the second time, the numbers are distinguished by an asterisk.*]

GREASE EXTRACTION—*cont.*
upon, into the river, 409, 1358–9, 1394, 1402, 3193–6, 3227, 3280–1, 3332–8, **4660**, **4664**, 4910, 7239–42. But the purification of moderately rich soapsuds would cost nothing, and of thin soapsuds very little, 1406–8, 364, 11,848. A small tax on manufacturers would be no hardship, and be more than compensated to them by pure water, 3585–6, 6825–8, **6836–40**, **6993–5**, 8525–30, **9328–30**, **11,131–40**, 13,362.

GREENWOOD, Mr. E. (of Huddersfield):
Evidence of, 3272*–3336*.

HASTINGS, Mr. (of Stainland):
Evidence of, 12,032–82a.

HEBBLE:
volume, 11,495–6, 11,505, see *Halifax*.

HEELIS, Mr. (of Skipton):
Evidence of, 14,712–24.

HEPTINSTALL, Mr. (of Castleford):
Evidence of, 15,968–16,120. 16,233–79.

HICK, Mr. M. (of Wakefield):
Evidence of, 1926–81.

HIGGINS, Mr. J. (of Leeds):
Evidence of, 8232–314.

HIRST, Mr. (of Leeds):
Evidence of, 7877–922.

HOBSON, Mr. J. (of Huddersfield):
Evidence of, 5403–22.

HOLDSWORTH, Mr. Alderman, (of Wakefield):
Evidence of, 544–608.

HOLDSWORTH, Mr. W. I. (of Halifax):
Evidence of, 11,362–493.

HOLLIDAY, Mr. R. (of Huddersfield):
Evidence of, 4706–49.

HOLMES, Mr. W. (of Wakefield):
Evidence of, 735–830.

HOLMES, Mr. J. (of Bradford):
Evidence of, 9505–59.

HOLROYD, Mr. (of Leeds):
Evidence of, 7923–8079.

HOPKINSON, Mr. J. (of Huddersfield):
Evidence of, 4706–49.

HORN, Mr. (of Castleford):
Evidence of, 15,468–570.

HORNER, Mr. (of Skipton):
Evidence of, 15,090–119.

HUDDERSFIELD:
Witnesses examined.
Chairman of Improvement Commissioners, Mr. Turner, 2919*–65*.
Surveyor to ditto, Mr. Abbey, 3104*–211*.

Sewage, 2927*–9, 3124, 3271*. Privies cleansed by Commissioners, 3220*–28. Water Supply, 3561–5, 5152–214, and see *Water Supply*. Topography of district, 3110*–21. Trade of district, *see* evidence of Mr. Mellor, 4147–285. Pollution of rivers from, *see* Papers by Mr. Thornton, **3271***–**2**; by Mr. Abbey, **3210***–**1**

HUNT, Mr. (of Castleford):
Evidence of, 16,428–83.

[*Numbers 2919–3467 are repeated in the Evidence: when the reference is made to the numbers as used the second time, the numbers are distinguished by an asterisk.*]

I.

ILLINGWORTH, Mr. (of Bradford):
Evidence of, 10,373–434.

INDIGO:
amount used, 1363. Proportion lost in dyeing operation, 1365–70. Not recoverable from spent vats, 416–8. Recoverable from soapsuds, 380–5, 419–25.

INGHAM, Mr. (of Bradford):
Evidence of, 9110–251.

INGHAM, Mr. (of Halifax):
Evidence of, 11,599–719.

J.

JEFFERY, Mr. (of Bradford):
Evidence of, 9684–709.

JESSOP, Mr. (of Castleford):
Evidence of, 16,200–32.

JOHNSON, Mr. J. (of Wakefield):
Evidence of, 152–282.

JONES, Mr. (of Huddersfield):
Evidence of, 3337*–78*.

JUBB, Mr. (of Batley):
Evidence of, 2363–481.

K.

KEIGHLEY:
Witnesses examined.
Chairman of Local Board, Mr. J.Craven, 13,093–149.
Consulting Engineer of do. Mr. Booth, 13,150–294.
Clerk to do. Mr. Burr, 13,370–451, 13,975–80.
Surveyor to do. Mr. Sharp, 13,821–94.
Inspector of Nuisances, Mr. Emmott, 13,895–974.
Superintendent of Gasworks, Mr. Craven, 13,728–820.
Mr. Ferrand, 13,295–369.
„ Dryden, 13,452–522.
„ Milligan, surgeon, 13,678–727.
„ Dixon, „ 14,597–621.
„ Hattersley, machine-maker, 14,109–78.
„ W. Smith, do. 13,523–614.
„ Cockshott, fellmonger, 13,615–77.
„ Brigg, worsted manufacturer, 13,981–14,108.
„ Clough, do. 14,365–454.
„ Laycock, do. 14,330–64.
„ Townend, do. 14,179–329.
„ Marriner, do. 14,543–515.
„ Sugden, do. 14,516–96.
„ Graham, do. 14,763–99.
Population, 13,094–5. Area, 13,252–60. Geological character of district, 13,269–74. Local Government. 13,374–415. Sewerage, 13,108; sewers insufficiently ventilated, 13,848–66, 14,780–7. Sewage passes into Aire, 5519–21, 13,109, 13,877–9. Privies, in case of neglect, are cleansed by Local Board, 13,147–8, 13,870–6, 14,777–9. Water Supply, 13,110–19, 13,211–51, and see *Water Supply*.

KENYON, Mr. (of Huddersfield):
Evidence of, 3808–903.

KNOTTINGLEY:
Witnesses examined.
Mr. Carter, brewer, 16,518–54.
Mr. Worfolk, shipbuilder, 16,688–750.
Population, 5,000, 16,705. Local Government Act, only nominally adopted, 16,361, 16,706–12. Sewerage very imperfect, 16,361. Sewage passes into river, 16,362. Water Supply, partly from wells liable to pollution, 16,356–60; partly from canal which has received Pontefract sewage and other pollutions, 16,545–7, 16,644–7, 16,721.

L.

LAYCOCK, Mr. (of Keighley):
Evidence of, 14,330–64.

LANDON, Rev. James J. B. (of Ledsham Vicarage, South Milford):
Letter from, 16,750.

LAW, as to pollution when amounting to public nuisance, difficult to put in force, 1036–45, 5681, **8770–2, 10,910**, 11,791–3: As to pollution, which is injurious to individual rights of property, 9658–966; difficult to put in force, 1046–7, 9637–40, 12,013–4; invidious as setting neighbour against neighbour, 3024*–5*, **3671**, 4088–93, 4234–6, 12,624–5, 13,361, **15,722–6**; unsatisfactory, as giving vested rights to individuals to pollute the river, whilst others are doing their best to keep it clean, 11,086, 14,311–3; and see *Litigation*.

LEAD MINES:
Pollution from, 8144–77.

LEATHER, Mr. G. H. (of Bradford):
Evidence of, 9862–912.

LEATHER, Mr. J. W. (of Leeds):
Evidence, 9982–10,232.

LEEDS:
Witnesses examined.
Mayor, Mr. Oxley, 5423–80.
Town Clerk, Mr. Smith, 5626–705.
Borough surveyor, Mr. Fowler, 6172–260.
Inspector of Nuisances, Mr. Swale, 6506–660.
Officer of Health, Dr. Robinson, 6085–6171.
Mr. Smith, surgeon, 7733–66.
Dr. Chadwick, physician, 6660–776.
Chairman of Waterworks Committee, Mr. Alderman Carter, 7000–161.
Mr. Fenwick, surveyor, 5706–70.
„ Ellison, 5771–87.
„ Filliter, Consulting Engineer, 5788–6084.
„ Dresser, civil engineer, 8080–8231.
„ Smith, manager of gasworks, 7767–876.
„ Arnott, manager of new gasworks, 8579–629.
„ Bartholomew, engineer to Aire and Calder Navigation Company, 7300–468.
„ Wilson, secretary to do., 7468–505.
„ Mitchell, veterinary surgeon, 7665–7732.
„ Higgins, Cattle Plague Inspector, 8232–314.
„ Ferrand, (of Bingley), 5481–5579.
„ Darwin, (of Otley), 5580–5625.
„ Pollard, agent to Sir John Lowther, 6451–505.
Secretary to Chamber of Commerce, Mr. Hirst, 7877–922.
Mr. Alderman George, dyer, 6777–863.
„ Holroyd, do. 7923–8079.
„ Reffitt, do. 8464–578.
„ Alderman Yewdall, cloth manufacturer, 7163–399.
„ R. Nickols, tanner, 6261–451.
„ Alderman Tatham, skin-dresser, 7506–664.
„ R. Tennant, flax spinner, 6864–999.
„ Alderman Garside, colliery owner, 8315–463.
Population, 228,000 persons, 6182; increase, 6004–12; 7113–7, 6183–6. Area, 6177. Rateable value, 6185. Local government. 5627, 6178–81. Mortality, 6093–9, 6165, **7112**, 6132. Has 1,000 cellar dwellings, 6121. Water Supply, 5436–9, 5649–57, **5833–66**, 5891–5904, **5965–6055**, 6072–84; and see *Water Supply*. Sewerage, extent of, 6188–9; partial, 6764–6; sewers not ventilated, 7019, 8112–37, 8337–45; nor protected by flap-valves, 7022–6; and *see* evidence of Mr. Leather, **10,005–11**. Sewage outlet, 806, 819, **5583–6**, 5620–1, 5867–70, 5887–9, 6462–3, 6504, 6719, **7670–6, 7704–11, 8087–91**, 8098–102, 8112–7. Pollution extends below Castleford, 810–15, 8103–7, 15,487, 16,153–6; solid matter obstructs navigable channel at Castleford, 16,176, 16,191. Possibility of sewage irrigation below town, 5766, 7076; two areas, one of 10,000 acres, accessible by gravitation, the other of 5,000 acres free from residential property, but not available except with pumping, 5936–41; volume to be pumped, 10,000,000 gallons daily, 5942–53; cost of pumping, 2,300*l.* per annum, **5940–1, 5953–4**; less than present cost of cleansing privies, 7124–6, 8448–54; would be more than recouped by increase of value of land from irrigation, 5955–62. Privies, 12,000 altogether, of which 1,000 are under dwellings, 6121–3, 6514–25, 6659–60, Paper; emptied by corporation at a gross cost of 6,000*l.* to

[*Numbers* 2919–3467 *are repeated in the Evidence: when the reference is made to the numbers as used the second time, the numbers are distinguished by an asterisk.*]

LEEDS—*cont.*

7,000*l.* per annum; and a net loss of from 2,200*l.* to 4,000*l.* 5691–5, 6526, 6538, **6646–8**, 7046–53, 8448–54. Cleansing process a nuisance; the state of Leeds from 10 o'clock at night till about 4 in the morning, something fearful, 6527–30. Becks polluted, 5669–71, 5800–2, 6089–90, 6194–207, 6225–8, **7079**, **7627**, **7746–9**, 8430–1; occasionally, not systematically, cleansed by corporation, 6228; to be improved under recent statute, 6233–4, *see* Paper by Mr. Fowler, 6260–1. Trades in cloth, iron, flax, tanning, 5630, 6056; *see* Evidence of Mr. Hirst, secretary of the Chamber of Commerce, 7877–922. Manufactories on river, *see* Table put in by Mr. Fowler, 6260–1; **6659** Paper.

LEGISLATION FOR RIVERS:

Necessary, 1488, 1967, 2059, 2099, 2470, 2475, 2522, 2745–7, 2751, 2890–3, 2913–4, 2937*, 2964–5, 3178–88, 3574, 4092, 4278, 4352, 4704–5, 5407, 7082, 9638, 10,110, 10,544, 10,929, 12,846–7, 12,885, 13,323, **13,358–62**, 14,298, **16,191**, 16,410; voluntary combination to prevent pollution has been tried and failed, 11,086–90, **12,009–13**, **12,031**, 12,820–6.

Caution requisite as to; manufacture is bread to the people, 2932,* **5440**; value of manufacturing interests, **10,452–65**, 11,128. Competition, both home and foreign, 5075, 8051, 10,448–50.

Must be compulsory, not permissive, 142, 2059, 2064, 2086, 2472, 2752, 2893, 3178–80, 3184–5, 2937*–8*, 3575, 3610, 4278, 4284, 5088, 5451–6, 6936–7, 8685, 12,013.

Must extend to whole district, 1523–4, 7082, 8651, 8797; to all rivers, 1491, 1523, 2064, 2098, 2104, 2123, 4232, 5068–9, 5096, 5456–7, 7081–2, 8711, 8797, 8820, 9498, 10,823, 10,983.

Should prohibit casting in of solid refuse, 2431–2, 2740–5, 2751, 2935*–6*, 3415*–7*, 4360, 4550–4, 4604, 8390, **8629–30** letter, **11,086**, 11,424, 11,802–3, 11,885, 12,016–19, 12,304, 12,510, 12,757, 12,902–7, 13,323.

Should prohibit casting in of sewage, 2061–4, 2081, 8647–52.

Should require grease to be extracted from soapsuds, 365–7, 1402–5, 1522, 3168–9, 9214–5, 10,592–4, 14,304–5.

With regard to other liquid pollution, should compel purification within reasonable limits. A small expense to each manufacturer would be no burden, because (*a*) It would be the same for all, and additional cost of manufacture would be recompensed by extra price charged to the public for manufactured article, 2064, 2748–50, 6409–10, 11,130, 12,848, 14,171–6, 14,411–18. (*β*) The expense would be more than compensated by gain of pure water, 3585–6, 6825–8, **6836–40**, 6993–5, 8565–30, **9328–30**, **11,131–140**, 13,362. To a large manufacturer 200*l.* per annum would be a trifling tax, 9328–30.

See *Conservancy, Law, Litigation, Pollution, Sewage, Solid Refuse.*

LIME:

At tanneries carted away, 1590, 1628, 6341. Accumulated at gasworks so as to be occasionally a nuisance, 1998–9.

LITIGATION:

On account of river pollution, 2391–7, 2510, 3428, 3696, 3708, 3822, 6303, 8697, 9118, 9642, **9933–9**, **9953–4**, 10,909, 11,775–84, 12,013; as to Bradford canal, *see* Evidence of Mr. Crowther, 10,655–708, Mr. Jeffery, 9684–709; Mr. Mumford, 10,640–54.

On account of casting in solid refuse, 3666–71, 4408, 5542, 11,086, 11,950–6, 12,609–616, 13,430–45.

On account of floodings caused by abuse, 12,778.

On account of flushing out reservoirs, 14,265–88.

LODGING HOUSES:

See evidence of Mr. Clough of Huddersfield, 5319–86.

LORD, Mr. E. (of Todmorden):
Evidence of, 12,962–13,000.

LORD, Mr. Josiah (of Todmorden):
Evidence of, 12,894–935.

IV. Law concerning.
V. Legislation.
VI. Modes of prevention.

I. Causes.
From sewage. Of Batley, 2316, 2388. Bingley, 13,471, 14,352–4, 14,364. Bradford, 8654. Castleford, 15,502–4, 16,235–6. Dewsbury, 2209. Halifax, 10,829, 10,843, **10,901–10**, 11,502–5. Harrogate, 5771–87. Honley, 4436. Huddersfield, 2927*–9*, 3124.* Keighley, 5519–21, 13,109, 13,877–9. Knottingley, 16,362. Leeds, 806–15, 5889, 8103–7, 15,847, 16,153–6, 819, 5583–6, 5620–1, 5887, 6462–3, 6504, 6719, **7670–6**, **7704–11**, 8087–91, 8098–102, 8112–7, 5584, 5621–5, 5761–5, 7680–2, 8259, 5942, 6484, **16,176**, 16,191. Lockwood, 4607. Mold Green, 5312 Paper. Pontefract, 15,348–57, 16,714–5, 15,368–77, 15,461–7, 15,708–21, 16,540–5, 16,644–7. Wakefield, 85-6 Paper, 98, 111, 253–8, 260–8, 561–2, 618, 2133, 270–3, 563, 618, and *see Sewage*.
From Privies, &c., of manufactories, 1372–5, 4169–74, **6260–1** Table, 6574, 6924–5, 7550, 10,283–5, 11,297–300, **12,886–9**, 14,140–5, and *see Privies*.
From Night-soil tipped in, 3288*–91*.
From Carcases thrown in, 50, 679–82, 1297–1302, **5643–4**, 677–8, 707–12, 754–5, 1244, 2284–5, 2413. 3072, 3464–7, 5509–11, 5586, **6539–44**, 6720, 6944–50, 7196–8, 15,119, 16,031–9, 16,132–6.
From manufacturing refuse:
Of chemical works, 789–90, 1273–6, 3923–9, 6601–7, 11,950–6, and *see Chemicals*.
Of Cocoa-nut Fibre works, **543–4**, Paper 103–5, 472–4, 1544–1616, 2149, 2170 Paper.
Of Dyeworks universal, 3210–1 Table and *passim*. See also *Dye Waste Liquid*, and *Grease Extraction*.
Of Malthouses, 100–2, 3086–99, 15,560–70, 16,103–4, 16,533–4, 16,548–54, 16,562–3.
Of Paper Mills, 12,032-82a, 12,249–90.
Of Tan Yards, 5634, 6281, 7526, 8524, 14,291–3, and *see Tanning*.
Of Wireworks, 11,344, 11,283–361.
Of Wool-dressing, greasy soapsuds, see *Grease Extraction, Wool Manufacture*.
From Ochrey water of mines, 3003–40, 3884–5, 4369, 4417–22, **4630–1**, 4933–4, 5040–5, 12,849–57.

II. Extent.
Present state of streams as compared with former state; of Aire and its tributaries, near Bradford, 8657, 8662, 8727, 10,087–91, 10,302–7, 8913, 9476–89, 9507–25, 9560–78, 9698, 9941, 10,000, 10,303–7, 10,767–79, 10,785–7. Near Castleford, 15,491, 15,527, 15,544–9, 16,009–15, 16,030, 16,046–52, 16,125–9, 16,378, 16,686. Near Keighley, 13,155. Near Knottingley, 16,693–704, 16,721. Near Leeds, 5428–30, 5485–8, 5497–8, 6087, **6260–1** Tables, **6462**, 6637–40, **6664–5**, 7170–9, **7670–6**, 8084–6. Of Calder and tributaries, near Dewsbury, 2278–82, 2378–9, 2487, 2565–70, 2604, 2682, 2688, 2856, 2906–9, 2917–8, 3048, 3156, 3263–79, 3358–63. Near Halifax, 10,901–2, 11,265, 11,390, 12,436–41, 12,450, 11,824, **12,595**, 12,010–2. Near Huddersfield, 2961*, 2976*–8*, 3012–5*, **3210–1** Paper, **3271*** Paper, 3350*, 3906–7, 4541, 4574, 4832. Near Wakefield, **85–86** Paper, 106, 119, 121, 130, 281, **543–4** Paper, 673–6, 747, 1034, 1271, 1339–46, 1844, 1861, 1965–6, 2053, 2126.
Smell, 119, 248, 604, 724–8, 783–8, 1246, 1389–93, 1967, 2053, 5312 Paper, 5434, 6462, 6719–20, 6462–3, **6943**, **7672**, 7704, 9575–7, 10,302–7, 11,397–400, 12,012, 12,082, 12,450, 14,696–7.

III. Effects—
1. On health, 120, 248–9, 254–5, 525–7, **543–4** Paper, 3994–4004, 6166–7, 6720, 12,442, 13,483-90, 13,504–14, 13,877–82, 16,046–52.
2. On the poor, spoils their natural water supply, compels them either to buy water, 3189*–93*, 4756–62, or to drink it impure, 5557, **16,351-60**, 16,721.
3. On riparian property and owners of cattle, 2055, 3194*–5*, 3369*–71*, 4078–81, 5572–9, 5584, 5621–5, 5761–6, 7680–2, and *see* evidence of Mr. Mitchell, 7665–732, 8259.
4. Upon manufactures:
Pure water requisite for manufactures, 1342–6, 1352–4, 2681, 7179–80, and *passim*. In some parts water of river and becks still used for washing, 1342, 1846; for flax works, 6878; and for dyeing, 1342, 1846, 4157–8, 4572. If water a little polluted, palliatives possible, filtration, 3060–1, chemical appliances, 6785–7, 8554–8, **2860–71**, involving additional cost of 33 per cent. As pollution increases, finer and lighter colours have to be given up by dyers, 1341–6, 1409–15, 1848–52, 1856, 2592, 3079*–81*, 3265, **8475–84**, 8566, 12,114; then water becomes altogether unfit for dyeing, 3412*, 3956, 4389, 4833, 7944–5; manufacturers have either to move their works higher up the stream, **124–7**, **1345**; or to becks, 2732; or to another district, 2517–8; or to procure an independent supply either from canal, or wells, or private reservoirs, or public waterworks. This generally the case in Aire and Calder basin, 2511, 3124*, 11,464, and *passim*. Cost of water pumped from wells, 9135–7, 9160–7, **9193–8**, **9289–93**, 11,109, **11,136–43**, 11,668, 12,208; of water from private reservoirs, 12,208; of water from reservoirs formed by combination amongst manufacturers, 4873–83; of the water brought from public waterworks, 1462, 1470–1, 2513–16, 2735–9, 7274, **8890–1**, 10,214–7, **11,134–43**, 11,290–3, 11,374–7, 11,658–74, 12,094–100. The water of rivers and becks must, if law does not interpose, become useless for all purposes of manufacture, except as steam power, 2471, 2551–3, 2683, 2780, 3361*–64*, 6938–40, 7522, 11,033, 11,483.
5. Litigation produced, 2391–7, 2510, 3428, 3696, 3708 3822, 6303, 8697, 9118, 9642, **9933–9**, 9953–4, 10,909 11,775–84, 12,013; also 10,655–708, 9684–9709 10,640–54.

IV. Law concerning Pollution, see *Law*.
V. Legislation requisite, see *Legislation, Conservancy*.
VI. Modes of prevention, see *Dye Waste, Grease Extraction, Maltsters, Sewage Irrigation, Tanning Refuse, Ochrey Waters*.

[*Numbers* 2919–3467 *are repeated in the Evidence: when the reference is made to the numbers as used the second time, the numbers are distinguished by an asterisk.*]

PONTEFRACT:

Witnesses examined,

Mayor, Mr. Routledge, 15,334–77.
Town Clerk, Mr. Coleman, 15,571–633.
Street Commissioner, Mr. Wordsworth, 15,634–703a.
Inspector of Nuisances, Mr. Fernside, 15,378–467.
Manager of Waterworks, Mr. Turpin, 15,750–826.
Manager of Gasworks, Mr. Gundill, 15,827–70.
Officer of Health, Dr. Muscroft, 16,627–54.
Dr. Atkinson, medical practitioner, 16,574–626.
Mr. Moxon, maltster, 16,555–71.
„ Wood, 15,704–49.
„ Horn, flint grinder, 15,468–570.
„ Heptinstall, corn-miller and maltster, 15,968, 16,120.
„ Brooke, farmer, 16,655–87.
„ Hartley, Bridge Master to West Riding, 15,871–967.

Population, 15,335. Rateable value, 15,337. Local government double, by Corporation and Street Commissioners, 15,340–6, 15,571–684, 16,564–8, 16,599–608, 16,640–1. Mortality, 26 in 1000, 16,569; increasing, 16,630, **16,642**; fever and epidemic diseases decidedly increasing from neglect of sanitary conditions, 16,576–9, 16,633–9. Sewerage, 15,347, 15,417–26, 15,683–8, 15,875–9; very partial, 15,707; neglected, 16,579; and offensive, 16,569, 16,633. Sewage passes into canal, 15,348–57, 15,368–77, and see *Sewage*. Water supply, 15,363–5, 15,694–701, 16,633, and see *Water Supply*, and evidence of Mr. Turpin, 15,750–826. Waterclosets, 175 in number, 15,385. Privies injuriously close to houses, 15,389–91, 16,583, 16,714–15. Are cleansed by owners, 15,428–30. Gasworks, *see* evidence of manager, 15,827–70.

PRIESTLEY, Mr. (of Todmorden):
Evidence of, 12,936–61.

PRIVIES:

At manufactories. Contents passed into river, 1372–5, 4169–74, **6260–1** Table, 6574, 6924,5, 7550, 10,283–5, 10,482–4, 11,297–300, **12,880–9**, 14,140–5. No privy arrangements for 700 men, **8378–82**. Contents used for manufacture, 9868. Contents put on land, 2611–12, 3866, 4304, 4397, 4516–8, 4884–8, 5034–8, 7244–9, 7549, 8075–7, **9187**, 9306–10, 9866–8, 9931–2, 10,283, 10,388–93, 10,808 Letter, **11,019–23**, 11,365, 11,384, 11,675–81, 11,770–2, 11,835–7, 11,907–10, 12,019, 12,047, 12,105–7, 12,227–9, 12,366–7, 12,639–40, 12,660–2, 12,684–6, 12,749, 12,829–30, 12,886–9, 12,949–61, 13,124, 13,148, 13,919–21, 14,008–11, **14,040–4**, 14,203–7, 14,341–2, 14,384–7, 14,479–81, 14,519–21, 14,683–4, 14,744–5, 14,816, 15,100, 16,406–9, 16,559–61. Contents of none ought to be suffered to pass into the river, 7553, **11,093–5**.

„ Batley, 2328–38.

„ Bingley, systematically inspected and cleansed under Commissioners, 13,491–5.

„ Bradford, about 14,000 in number, cleansed by Corporation at a cost of 2,700*l.* per annum, 8846–56; not one placed under dwellings, 8863–5; if converted into waterclosets, removal of dry ashes would cost nearly as much as before, 9052–4.

„ Castleford, sometimes injurious to health, 16,074–9, 16,293–309.

„ Dewsbury, 2243–9, 2253–5, 2287–94, should be cleansed out at shorter intervals.

„ Halifax. Some 1,500 or 1,600 ashpits, 11,596–8; injurious to poor, 12,451–5; some are placed over stream, 12,480–1; most are cleansed by Corporation, only in default of owner; loss to Corporation from process last year, 100*l.*, 10,920–7.

„ Huddersfield, cleansed by Commissioners, 3219*–28*.

„ Keighley, in case of neglect, are cleansed by Local Board, 13,147–8, 13,870–6, 14,777–9.

„ Leeds, 12,000 altogether, of which 1,000 are under dwellings, 6121–3, 6514–25; emptied by Corporation at a gross cost of 6,000*l.* to 7,000*l.* per annum, and a net loss of from 2,200*l.* to 4,000*l.*, 5691–5, 6526, 6538, **6646–8**, 7046–53, 8448–54; cleansing process a nuisance, "the state of Leeds from 10 o'clock at night till about four in the morning something fearful," 6527–30.

„ Pontefract, injurious to health, 15,389–91, 16,583, 16,714–15; owners are called upon to cleanse, 15,428–30.

At Skipton, cleansed by authorities, if neglected by owners, 14,635, 14,907–13; their conversion into water closets found advantageous to health, 14,873–81.

„ Todmorden, 12,734–9; regulations by Local Board as to, 12,949–60, 13,042–3.

„ Wakefield, cause of ill-health and fever, 167–99, 286–94, 182, 532–8; difficulty of cleansing, 204–12; amount of contents annually removed, 167–73; in default of owners, cleansed by Corporation, 207; also exceptionally cleansed by Corporation from fear of cholera, 43–7; better, but more expensive, for Corporation to undertake the whole work of cleansing, 213–16. On the whole improved, 157–8. Contents of workhouse privies put on land, 275.

R.

RAINFALL:

In Aire Dale, **5,770** Tables; at Halifax, 12,416; in Hebble Valley, 11,272–5; at Huddersfield, 5174–7, 5259; at Keighley, 13,226–8; at Leeds, 5813–32, 9616–17; at Skipton, 15,249; at Wakefield, 1693.

RAVENSTHORPE:

Witnesses examined:
Clerk to Local Board, Mr. Rayner, 3105–33.
Mr. Wormald, dyer, 3134–257.
Mr. Tattersfield, fulling miller, 3258–353.
has no water supply, 3113–18; is not sewered, 3121.

RAWSON, Mr. (of Halifax):
Evidence of, 12,125–95.

RAYNER, Mr. (of Ravensthorpe):
Evidence of, 3105–33.

RESERVOIRS:

Equalize river-flow and diminish floods, 3081, 3424–5, 3264*–6*, 4871–2, 10,002, 14,012; payment by manufacturers for use of, 3551–6, 3579, 3597, **4873–83** 4957–8, 8062–8, 8223–31, 8915–31, 10,165–8, 10,927, 14,208–14; and *see* evidence of Mr. Brigg, 14,012–25 Provision as to bye-wash of, 10,192–298, 11,562–89, 14,933–57, 14,107–8; sometimes discharged carelessly, 13,298–309.

RHODES, Mr. (of Wakefield):
Evidence of, 1–85.

RICHARDSON, Mr. (of Halifax):
Evidence of, 11,255–82, 11,494–598.

RIDGWAY, Mr. (of Dewsbury):
Evidence of, 2561–84.

REFFITT, Mr. (of Leeds):
Evidence of, 8464–578.

RILEY, Mr. (of Esholt Hall):
Evidence of, 9560–616.

RIPARIAN PROPRIETORS:

See evidence of Mr. Constable, 9617–83; Mr. Darwin, 5580–625; Mr. Ferrand, 5481–579, 13,295–369; Captain Graham, agent to Sir J. Ramsden, 4072–5146; Mr. Holmes, 9505–59; Mr. Mitchell, 9463–504; Mr. Nicolson, agent to Sir R. Tufton, 15,205–94; Mr. Pollard, agent to Sir John Lowther, 6451–505; Mr. Riley, gardener, 9560–91; Colonel Smyth, 2051–113. Should be bound to cleanse river-bed, 5517. Increase of value of land from growth of manufactures, 9217, 9323–5, 9634–5.

RIPLEY, Mr. (of Bradford):
Evidence of, 10,435–639.

ROAD SCRAPINGS:

Thrown into river, 3199*–3202*, 12,010–628, 12,913–15, 12,948, 13,161–2, 13,623, 13,829–30; might be usefully applied to raising land, 3208*–10*; at Leeds 9,000 tons sold annually, 6589–91.

ROBINSON, Mr. (of Honley):
Evidence of, 4365–455.

ROBINSON, Dr. (of Leeds):
Evidence of, 6085–171.

ROBSON, Mr. (of Mold Green, Huddersfield):
Evidence of, 5260–310.

Numbers 2919–3467 are repeated in the Evidence: when the reference is made to the numbers as used the second time, the numbers are distinguished by an asterisk.]

Rodley, Mr. (of Todmorden):
Evidence of, 13,001–45.

Roodhouse, Mr. (of Wakefield):
Evidence of, 1067–95.

Routledge, Mr. (of Pontefract):
Evidence of, 15,334–77.

S.

Salmond, Mr. (of Bradford):
Evidence of, 10,750–94.

Sanitary Arrangements. See *Lodging-houses. Privies. Scavenging. Sewage. Sewerage. Smoke. Water-closets. Water Supply.*

Scavenging:
Of river, necessary and neglected. Nuisance of floating carcases, 50, 677–82, 707–12, 754–5, 1244, 1297–302, 2284–5, 2413, 3072, 3464–7, 5509–11, 5586, **5643–4**, 6539–44, 6720, 6944–50, 7196–8, 15,119, 16,031–9, **16,132–6**; at Leeds the scavenger has removed 50 carcases in a day, 6542.

Scott, Mr. (of Skipton):
Evidence of, 14,725–62.

Seed, Mr. (of Huddersfield):
Evidence of, 5114–51.

Sewage:
Of sewers (sewerage being in every town only partially adopted) of Batley, passes into beck, 2316–88.
„ Bingley, passes into Aire, 13,471, 13,352–4, 14,364.
„ Bradford, passes into beck, 8654.
„ Castleford, passes into Aire & Calder, 15,502–4, 16,235–6.
„ Dewsbury, passes into Calder, 2209.
„ Halifax, its volume, 11,502–5; passes into beck, 10,829, 10,843, **10,901–10**.
„ Harrogate, passes into river Nidd, and spoils water supply of Knaresboro' 5771–87.
„ Honley, passes into stream, 4436.
„ Huddersfield, passes into Colne and canal, 2927*–29*, 3124.*
„ Keighley, passes into Aire, 5519–21, 13,109, 13,877–9.
„ Knottingley, passes into Aire and Calder, 16,362.
„ Leeds, its volume, from 6,000,000 to 8,000,000 gallons daily, 5942; increasing from increase of population and extension of sewerage, 6484; passes into the Aire, its effect at the outlet, 806–9, 819, 5583–9, 5620–1, 5887, 6462–3, 6504, 6719, **7670–6, 7704–11**, 8087–91, 8098–102, 8112–17; possibly predisposed to cattle plague, or aggravated plague, 5584, 5621–5, 5761–6, 7680–2; *secus*, 8259. Pollution extends below Castleford, 810–5, 8103–7, 15,487, 16,153–6; the solid matter obstructs navigable channel at Castleford, **16,176**, 16,191.
„ Lockwood, passes into river, 4607.
„ Mold Green, passes into river, **5312** Paper.
„ Pontefract, is collected into tanks and allowed to get putrid, 16,714–5; passed thence into Goole canal, 15,348–57, 15,368–77, 15,708–21. Goole canal runs through Knottingley, and inhabitants of Knottingley draw part of their water from this polluted source, 16,544–7. The canal enters Ouse at Goole, 15,461–7. The sewage tanks are a nuisance, 16,540–5.
„ Wakefield, passes into river, **85–6** Paper III.; even sewage of Asylum, 270–3, 563, 618; and prison, 98, 253–8, 260–8, 561–2, 618, 2133. Flood of, beneath floor in prison, immediately caused diarrhœa amongst inmates, **2146**.
Law against casting into streams, quite inoperative, 2118–22. See *Sewerage, Waterclosets. Pollution. Legislation.*

Sewage Irrigation:
Right to be carried out, though it cost a town like Wakefield 1,000*l.* per annum, 82–3. Successfully carried out by Mr. Ferrand, 5526–33; and at Grange, 6476–80. Objected to, 11,181, 11,184–98. Is sewage of manufacturing town valuable for irrigation? 6486–93. Cost of pumping sewage according to Mr. Filliter one halfpenny per 1,000 gallons for pumping 250 feet, **5856–8, 5940–1**, 5953–4; as compared with cost of removing contents of privies, 7124–6, 8448–54; as compared with a gravitation scheme of irrigation, 5905–11. Valley of Aire generally fitted for, 5526, 5767. No land available immediately below Bradford, 9068–9, 10,114; and volume of sewage to be pumped 20,000,000 gallons daily, 8935–40; land available below Castleford, 16,264–5, 16,514–5; below Keighley, subject to the necessity of pumping, 13,264–6; below Leeds, 5766, 7076; two areas, one of 10,000 acres accessible by gravitation, the other of 5,000 acres free from residential property, but not available except with pumping, **5936–41**. Volume to be pumped, 10,000,000 gallons daily, 5942–53; cost of pumping, 2,300*l.* per annum, **5940–1, 5953–4**, less than present cost of cleansing privies, 7124–6, 8448–54; would be more than recouped by increase of value of land caused by irrigation, 5955–62. Below Pontefract, land available, 15,692–3, 16,563. Below Skipton, valuable meadow land available without pumping, 14,655–63 14,893, 15,231–40.
Valley of Calder: no land available near Dewsbury, 2787–93; or Huddersfield, 3150*–6*, 4136–40; or Ravensthorpe, 3133; or Todmorden, 12,861. Land available near junction of Hebble and Calder, 11,199–204; and below Wakefield, though pumping would be necessary, 51, 64–6, 1100, 1147–8.

Sewerage:
Of Batley, 2315, 2324–6.
Bradford, sewers insufficiently ventilated, 8945–64, 9951–2.
Castleford, partially carried out, and sewers not at all ventilated, 16,227–30, 16,250–3; mouths of sewers unprotected, 16,254–8; part of sewer is open, and filled with stagnant sewage, 16,260; sewers are liable to be back-watered, so as to flood cottages, 16,239–44, 16,271–9. *See* evidence of Mr. Heptinstall, 16,233–79.
Dewsbury, 2208–21.
Halifax, still in progress, 10,843; sewers insufficiently ventilated, 10,817; 10,832–6, **11,526–31, 11,556**, 12,529.
Huddersfield, 2927*; sewers not ventilated, 3124,* 3168*–72.
Keighley, 13,168; sewers insufficiently ventilated, 13,858–65, 14,780–7.
Knottingley, a rude and imperfect system, 16,361.
Leeds, extent of, 6188–9; partial, 6764–6; sewers not ventilated, 7019, 8112–37, 8337–45; not protected by flap valve, 7022–6. *See* evidence of Mr. Leather, 10,005–11.
Pontefract; 15,347; very partial, 15,707; ill-flushed and ill-ventilated, 15,417–26, 15,683–8, 15,875–9, 16,569; not trapped, 16,633; and neglected, 16,579–85.
Skipton, 14,866–73; sewers well flushed, 14,883; imperfectly ventilated, 14,884–9. Drains connected with sewers are ill-constructed, and injurious to health, 15,212–8.
Todmorden, very bad, 12,858–60.
Wakefield, incomplete, 20, 76, **85–6**, Paper, 610–2, 633–5; plans of, old, 627–33, 1100–9. Sewers ill-ventilated and ill-flushed, and so very foul, 620–6; effect of bad ventilation of sewers of prison, **2141**. Outfall of sewers too low, 1105. Private drains ill-constructed, 1110–3.

Sharp, Mr. (of Keighley):
Evidence of, 13,821–924.

Shaw, Mr. (of Halifax):
Evidence of, 12,331–412.

Shoddy, no cause of river pollution, 2412. *See* evidence of Mr. Jubb, 2363, 2481

Sidgwick, Mr. C. (of Skipton):
Evidence of, 14,621–66.

Sidgwick, Mr. R. (of Skipton):
Evidence of, 14,667–724.

Simpson, Dr. (of Pontefract):
Evidence of, 16,280–371, 16,572–3.

[*Numbers* 2919–3467 *are repeated in the Evidence: when the reference is made to the numbers as used the second time, the numbers are distinguished by an asterisk.*]

SIMPSON, Mr. (of Castleford):
Evidence of, 16,372–427.

SKIPTON:
Witnesses examined:
Chairman of Local Board, Mr. Sidgwick, 14,622–66.
Surveyor of Local Board, Mr. W. Bradley, 14,864–922.
Vice-Chairman of Board of Guardians, Mr. B. Bradley, 15,120–204.
Manager of Waterworks, Mr. Calvert, 14,923–15,008, 15,295–308.
Foreman of Gasworks, Mr. Clarke, 15,309–33.
Registrar of Births and Deaths, Mr. Bailey, 15,065–89.
Mr. Marsden, surgeon, 15,009–64.
,, Heelis, 14,712–24.
,, R. Sidgwick, cotton spinner, 14,667–724.
,, Dewhurst, cotton spinner, 14,800–63.
,, Horner, lead manufacturer, 15,090–119.
,, Scott, brewer, 14,725–62.
,, Nicolson, agent to Sir R. Tufton, 15,205–94.
Population, 14,628. Trade, 14,631. Rateable value, 14,642.
Mortality, 26 in a thousand, 15,069, and *see* evidence of Mr. Bailey, 15,065–89, 15,147–53. Health improved, 15,013–29. Sewerage imperfectly constructed, 14,633, 14,866–73, 15,212–28; See *Sewerage*. Sewage; contents of sewers pass into river, 14,639–45. See *Sewage*. Cesspools, 14,634–7, 14,874–81, 14,907–15; 100 waterclosets, 15,212–28. Water Supply, 14,923–15,008, 15,295–308, and see *Water Supply*. Gasworks, 15,309–33.

SLEE, Mr. (of Bradford):
Evidence of, 9710–67.

SMITH, Mr. C. (of Leeds):
Evidence of, 7767–876.

SMITH, Mr. J. E. (of Leeds):
Evidence of, 5626–705.

SMITH, Mr. F. (of Halifax):
Evidence of, 11,283–361.

SMITH, Mr. G. (of Wakefield):
Evidence of, 1222–34.

SMITH, Mr. S. (of Bradford):
Evidence of, 9252–9349, 10,709–49.

SMITH, Mr. S. (of Leeds):
Evidence of, 7733–66.

SMITH, Mr. W. (of Keighley):
Evidence of, 13,523–614.

SMOKE PREVENTION, 11,858–67, 11,967–78, 12,140–95, 12,306–17, 12,347–51, 12,389–410, 12,513–25, 12,927–35, 12,995–13,000, 13,349–53, 13,588–98. Produces much less ash, **12,190**.

SMYTH, Col. (of Wakefield):
Evidence of, 2051–113.

SOAP MANUFACTURE AND SOAPSUDS. See *Grease Extraction*.

SOLID REFUSE IN RIVER:
" I. Kinds of refuse.
II. Extent and effects of obstruction.
III. Necessity of legislative interference.

I. Kinds of refuse:
Ashes, tipped into streams, 756–7, 1249–50, 1294, 1324–34, 2381, 3016*, **3210*** TABLE, 3399*–401*, 3523–7, 4303–4, 4575, **4613**, 4823, 5017, 5501–4, 12,671–4, 12,682, 12,687–701, 12,746–7, 12,793–6, 12,802, 12,874–5, 12,632–8, 14,127–34. Carted away, 1350, 1638, 1858–60, 1878–9, 3127–8, 3813–4, 4164–6, 4376–7, 4514–726, 5270–1, 6799, **6889**, 7192, 7647–52, 7870–1, 8038–42, 8519–20, 9140–4, 9296, 9924–6, 10,288–92, 10,380–2, **10,513–9**, **11,009–18**, 11,155–60, 11,294–6, 11,368–71, 11,604–6, 11,728–30, 11,832–4, 11,903–6, 12,090–3, 12,136–9, 12,201–2, **12,345**, **12,352–3**, 12,618–20, 12,965–9, 13,530–41, 14,339–40, 14,458, 14,486–8, 14,557–61, 14,818–9, 15,496–501, 15,974–6, 16,380–2. Expense of removal of, 1878–83, 6801, 6900–1, 8041, 11,018, 13,537–9, 14,134, 14,155–60, 14,340. Might be utilized for roads, 3124* and *passim*, when ground served as a substitute for sand in cement, 2936*, 4514, 4731–6. Ordinary proportion of ashes from coals, 4368, 4641, 4821–2, 6884; might be greatly reduced by proper consumption of smoke, 12,190. All ashes should be kept out of streams, 3391–2, 3019*, 3528, **6893–8**, 9302, **10,519–23**, 11,092, 11,455, 11,710, 12,117, 12,622–3.
Debris from mountains, 3271*–2* Paper, 3318, 12,699 how to be intercepted, **57,314**, 12,814–7, 12,908–10, 12,978, 15,164–9, 15,272–6.
Dyewood, thrown into river, 2240, 2381–2, 2571–6, 2583, 6790, 7958, 9125–9, 12,218–20; to the great injury of the bed, 793–6; might be all kept out without hardship to manufacturers, 1868, 2503–9, 2538–9, 2625–6, 2723, 2740. Its use for land may be questionable, 2713–21, 10,493, though it is occasionally bought by farmers, 8507–10; but chipped dye-woods are easily collected, and burnt under boilers, 1437, 1590, 2601–2, 2722, 3036*, 3397*, 5291, 8511, 11,641, 11,993–9, 12,104, 14,810–2. Rasped dyewoods may be collected with a little trouble, and though unfit for fuel, may be made into a spoil heap, and so burnt, 6793, 6841–3, 7974–6, 9297, **10,495–505**, **11,099–106**, 11,643–5, 11,760–1, **12,024–6**.
Excavations, 2934,* 3122*–3,* 4085, 4408–9, 12,323, 12,764, 12,970–1, 13,622, 13,831, 14,160.
Foundry refuse, 5504, 13,622.
Fuller's earth, 3244–54.
General refuse, **5500**.
Lead-mines, **8141–77**.
Road scrapings, 3199*–202, 12,010, 12,628, 12,913–5, 12,948, 13,161–2, 13,623, 13,829–30; might be usefully applied to raising land, 3208*–10*; at Leeds 9000 tons sold annually, 6589–91. Sediment flushed out of reservoirs or tanks into the river, to be flushed again successively by millowners lower down the stream, 2837–55, 3208–16, 3051*–75,* 3061*–2,* 3532–5, 4432–3, 4824–7, 10,471, 10,524, **10,528–33**, 11,040–8, 11,268–70, 12,380–8, 13,629–30, 14,265–88, 14,381–3, 14,562–4; out of canal into Calder, 12,585–95; can the mud so flushed out be utilized? 3214–6.
Sewage, 16,176–91.
Wool waste, 757–63, 1540–3, 4643–54.
II. Extent and effects of obstruction.
The bed is raised, 693, 3366–92, 3197*–8,* 3203,* 3302,* 3406,* 3529–31, 4386, 4520, 4549, **4616–7**, 4942, **5422** Paper, 5736–9, 8641–8, 11,265, 12,802–4, 12,898–901, 12,942, 13,156, 13,467–8, 13,515–22, 13,541–6, 13,619, 13,690, 13,736, 13,827, 13,832, 13,898–909, 14,056–7, 14,122, 14,148–51, 14,515, 15,933. Is the raising of the bed due more to refuse thrown into the stream or to mountain debris? 12,987–8, 14,160, 14,167, 13,159. Banks become irregular, 3123,* 4942. Floodings are caused, 3048,* 3204,* 3303,* 3537–40, 5422 Paper, 12,028–31, 12,634, 13,547–9, 13,599–614, and see *Floodings*. Drains are backed up, 13,157–8, **13-599–614**, 13,627, 13,814–9, 13,833–7, 13,923–40. Water-power is decreased, **11,942**, **12,602–16**, **14,099–100**. Navigation impeded, and the requisite dredging enormously increased, 740–7, 7635, 1224–43, 1253, 7318–33, 7348. **7467–8** TABLES, **16,153**, **16,169–76**. *See* evidence of Mr. Bartholomew, Engineer to Aire and Calder Navigation, 7300–468; of Mr. Holmes, 735–830; of Mr. G. Smith, 1222–334; of Mr. Oates, 3354–467; of Mr. Wilkinson, 16,121–99. Material dredged up, not sand, but ashes and filth, 1249–50, 1294, 3220–2, 3293, 3393–410, **16,174–6**, **16,189**.
III. Necessity of legislative interference—
The throwing in of rubbish is prohibited under the Aire and Calder Navigation Acts, 1326–34, 1871–8, 2060, 6890, 7485; but the prohibition applies only to Navigation Channel, not to becks, 2066–7, 7328–32, 7477–8.
All solid refuse should be excluded from all running streams, 2431–2, 2740–5, 2751, 2935*–6,* 3415*–7, 4360, 4550–4, 4604, 8390, **8829–30** Letter, **11,086**, 11,424, 11,802–3, 11,885, 12,016–9, 12,304, 12,510, 12,757, 12,902, 13,323, and see *Legislation, Conservancy*.

SPENCER, Mr. T. (of London):
Evidence of, 1714–837, 1982–2051.

STANSFIELD, Mr. (of Todmorden):
Evidence of, 12,702–39.

STATTER, Mr. (of Wakefield):
Evidence of, 1152–1221.

STEWART, Mr. (of Wakefield):
Evidence of, 1,642–70.

SUGDEN, Mr. (of Bingley):
Evidence of, 14,516–96.

SUTCLIFFE, Mr. (of Idle):
Evidence of, 9916–81.

Numbers 2919–3467 *are repeated in the Evidence: when the reference is made to the numbers as used the second time, the numbers are distinguished by an asterisk.*]

SUTCLIFFE, Mr. (of Todmorden):
Evidence of, 12,596–655.

SWALE, Mr. (of Leeds):
Evidence of, 6506–660.

SWALLOW Mr. (of Bradford):
Evidence of, 9350–462.

SYKES, Mr. (of Wakefield):
Evidence of, 831–1029, 1670–89.

T.

TANNERS:
Witnesses examined,
At Bradford, Mr. Slee, 9710–67.
„ Keighley, Mr. Cockshott, 13,649–77.
„ Leeds, Mr. Nickols, 6261–451.
„ Mr. Tatham, 7506–664.

TANNING:
Extent of at Leeds, 2,750,000 hides tanned in one year, 6369. Materials used, **6450** PAPER; in some cases human excrement, 6581–6. Abundance of pure water necessary, 6313–7, 6322–5, 6347–63, 6355–60, 7516–20, 7571–4. Waste products; spent solids led away for manure, 6284, 6341; spent bark burnt, 6300, or led away, 7652–60, 9278–9. Means of disposing of waste liquid must be had or the trade cannot be carried on, 6395–403, 6411. At present, waste liquid chiefly passes into stream, 5634, 6281, 7526, 8524, 14,291–3; fit for irrigation, only if ample area available, otherwise too strong and too salt, 6304–12, 6320–37; might be passed into sewers and, mixed with sewage, be applied for irrigation, 6364–6, 6378, 6405–6, 9759–65.

TATHAM, Mr. Alderman (of Buslingthorpe, Leeds):
Evidence of, 7506–664.

TATTERSFIELD, Mr. (of Ravensthorpe):
Evidence of, 3258–353.

TEALL, Mr. (of Wakefield):
Evidence of, 316–456.

TENNANT, Mr. R. (of Leeds):
Evidence of, 6864–999.

THOMPSON, Mr. (of Bradford):
Evidence of, 9762–862.

THORNHILL:
Witnesses examined:
Clerk to Local Board, Mr. Oldroyd, 2919–29
Mr. Charlesworth, maltster, 3041–104.
Mr. Maddison, colliery proprietor, 2930–3040.
Polluted canal the only water supply, **2934–63**.

THORNTON, Mr. (of Huddersfield):
Evidence of, 3211*–72*.

TINKER, Mr. (of Holmfirth):
Evidence of, 5215–59.

TODMORDEN:
Witnesses examined:
Chairman of Local Board, Mr. J. Fielden, 12,844–70.
Surveyor and Inspector of Nuisances, Mr. Rodley, 13,001–45.
Mr. Bamford, surveyor, 13,046–92.
„ Hamerton, solicitor, 12,772–85.
„ Buckley, machine maker, 12,656–74.
„ J. Lord, do., 12,894–935.
„ E. Lord, do., 12,962–13,000.
„ Stansfield, nurseryman, 12,702–39.
„ Sutcliffe, corn-miller, 12,596–655.
„ Chambers, cotton spinner, 12,740–71.
„ J. Fielden, do., 12,786–843.
„ R. Fielding, do., 12,675–701.
„ Ormerod, do., 12,871–93.
„ Priestley, draper, 12,936–61.
Not sewered, 12,859–60; suffers from floodings, *see* 12,596–13,092, and evidence taken at Todmorden, *passim*; especially, 12,641–5, 12,702–8, **12,754–6**, 12,974–5, **13,014–29**, 13,053–92.

TOWNEND, Mr. (of Cullingworth):
Evidence of, 14,179–329.

TURNER, Mr. (of Huddersfield)
Evidence of, 2919*–65*.

TURPIN, Mr. (of Pontefract):
Evidence of. 15,750–826.

TWEEDALE, Mr. (of Dewsbury):
Evidence of, 2900–18.

V.

VENTILATION:
Of sewers insufficient, *see Sewerage*.

VITRIOL WORKS:
See Evidence of Mr. Leather, 9862–912.

W.

WADE, Dr. (of Wakefield):
Evidence of, 283–315.

WAKEFIELD:
Witnesses examined.
The Mayor, Mr. Rhodes, 1–85, 2114–8.
Deputy Town Clerk, Mr. Morgan, 86–118.
Inspector of Nuisances, Mr. Johnson, 152–282.
Borough Surveyor, Mr. Lynam, 609–65.
Late Borough Surveyor, Mr. Crutchley, 1096–1151.
Manager of Waterworks Company, Mr. Sykes, 831–1029, 1670–89.
Solicitor, do. Mr. Lumb, 1030–66.
Consulting Chemist of ditto, Mr. Spencer, 1714–837 1982–2051.
Registrar of Union, Mr. Stewart, 1642–70.
Mr. Fowler, surgeon, 457–544.
„ Alderman Holdsworth, M.D., 544–608.
„ Milner, surgeon to Prison, 2124–70.
„ Statter, surgeon, 1152–221.
Dr. Wade, 283–315.
Dr. Wright, 2171–98.
Mr. Holmes, captain of dredger, 735–830.
„ G. Smith, do. do. 1222–334.
„ Woolass, aqueduct keeper, 666–734.
„ Teall, soap extractor, 316–456.
„ Wilson, soap maker, 1617–41.

Rev. Mr. Bowditch, 2199–201.
Area and Population, 18, 86–92; 118 Table. Rateable value, 19, 88; Local Government, 90. Health and mortality; death-rate increasing, 1653, 1669–70 Table. Manufactures, 118 Tables. The dyeing trade for Bradford or Leeds has now left Wakefield on account of pollution of Calder, 10–11, 124–7, 1345. Sewerage incomplete, 20, 76, **85–6** Paper, 610–2, 633–5; plans of, old, 627–33, 1100–9. Sewers ill-ventilated, and ill-flushed, and very foul, 620–6; effect of bad ventilation of sewers of prison, 2141; outfall of sewers too low, 1105; private drains ill-constructed, 1110–3. Sewage passes into river, **85–86** Paper, 111; even sewage of asylum, 270–3, 563, 618, and of prison, 98, 253–8, 260–8, 561–2, 618, 2133. Cesspits done away with almost entirely, 160–6. Privies, cause of ill-health and fever, 167–99, 286–94, 182, 532–8; difficulty of cleansing, 204–12; amount of contents annually removed, 167–73; in default of owners, cleansed by Corporation, 207; also exceptionally cleansed by Corporation from fear of cholera, 43–7; a better but more expensive plan for Corporation to undertake the entire work of cleansing, 213–6; on the whole privies improved, 157–8, Contents of workhouse privies put on land, 275. Waterclosets adopted for the rich, 99, 158, 200–3, 615–7; not for cottages, 202–3, 608. Slaughter-houses, 33–7, 217–24. Gasworks, 38–42. Water supply, from Calder below sewage outlet, see *Water Supply*. Rainfall, 1693. Gas works, 38–42. Becks, **543–4** Paper, 649–60.

[*Numbers* 2919–3467 *are repeated in the Evidence: when the reference is made to the numbers as used the second time, the numbers are distinguished by an asterisk.*]

WALKER, Mr., of Bradford:
Letter from, 10,808–9.

WATERCLOSETS:
At Bradford 1,500 in number, 8845; at Castleford, nine, 15,988; at Dewsbury, few, 2243–4; at Halifax, 960 in number, 10,837, 12,454, 10,918–9; at Keighley, discountenanced by Local Board, 13,125, 13,869, 14,763–79. At Leeds 3,000, 6026, and are approved by local authorities, 64, **6545–52**; still not 100 in workmen's houses, 6649, **7128**; at Pontefract, 175, 15,385; at Skipton, one hundred, 15,212–28; at Wakefield, partially adopted, but not approved of by Local Board for cottages, 99, 158, 200–3, 608, 615–7; used at mills with advantage, 10,482–4.

WATER-POWER:
3297–3306, 3376*–78*, 3386–90, 3507–14, 4708–14, 8750–3, 10,956–9, 12,376–7, 14,051–5, 14,102–6. Diminished by solids thrown into the river, 11,942, 11,957–60, 14,099–100.

WATER SUPPLY:
I. For Towns.
II. Value to Manufacture.
III. In reference to Geological Strata.

1. For Towns:
Bingley; springs collected into a reservoir, 13,472–4, 14,348–9.

Bradford: *see* evidence of Mr. Leather, 10,165–8; of Mr. Gott, **8866–999**, 8915–31, 9019–41; works owned by Corporation, 8866; supply unlimited, 883[illegible]; volume daily consumed 2,000,000 gallons for domestic use at rate of 16 gallons per head of population and public use, and 2,500,000 of gallons for trade purposes, 8880–2; price for trade purposes, 8890–1. Well supply, precarious; old wells are drained by new wells sunk deeper, 9198, 9281–9.

Castleford: no regular supply; population resort to wells liable to infiltration of sewage and to be drained by colliery pumpings, 16,508, 16,063–7, 16,215, 16,285–7, also to polluted river, 16,212–7, 16,285–91, 16,648–54, 16,669–75, 16,343 Paper, 16,357–60. Pollution of wells probably cause of cholera, 16,351–4.

Dewsbury: 2223–7.

Fartown; only polluted stream, 4759–66.

Halifax; *see* evidence of Mr. Norris, **10,853–900**; in hands of Corporation and very good, 10,815–6, 11,237; total volume and in what proportion distributed for domestic and trade consumption, 10,870; economy of, necessary, 10,876; deficiency of, has impeded development of trade, 10,996–7; contemplated extension of, 10,877–81. Penalties under Local Acts for not sending sufficient compensation water down the Hebble Valley, 10,896–99.

Huddersfield; *see* evidence of manager of works, Mr. Hare, 5152–5214. In hands of independent Commissioners, 2947*–8*, 2951*–3*, 5201–6, 5213–4; insufficient, 3561–5, 5178–82, 5193–4; reservoirs once ran dry, 5169.

Keighley; reservoirs in hands of Local Board, 13,110–9, *see* evidence of Mr. Booth, 13,211–60.

Knaresboro': polluted by sewage of Harrogate, 5771–87.

Knottingley: used to be from river then pure, 16,721; now partly from wells liable to pollution, 16,356–60; partly from canal which has received sewage of Pontefract and other pollutions.

Leeds: formerly by company from river Aire, 5436, 5999, 8326; now by Corporation from Wharfe, 6018–9, 5437–9, 5598–5604, 5617; supply for domestic use unlimited and constant, 6033–4; volume used 16 gallons per head, 6006–9; and *see* evidence of Mr. Filliter, 5833–66. Volume supplied to manufacturers 500,000 gallons daily, 6007; charge 6*d.* per 1,000 gallons, 6021. Manufacturers want more and more, and their wells are failing, 6022–3, 6073–4; the richest sink the deepest wells, and so drain those of their neighbours, **7135–41**. Quality, 5894–7, 8222. 10,071. Wharfe becoming polluted by sewage and manufacturing refuse, 5893, 5898–902, 6114–7, 7093–5, 8187, and is peaty, 5916, 7151–2; can peatiness be prevented? 6081–4. A new supply required of water, more pure, more soft, more abundant, 5893, 5903–4, 7090; proposed source, the Washburn, 5931–5, 5965–98, 5990–3, 8188, 10,018–38, 10,071.

Pontefract; *See* evidence of Mr. Turpin, 15,750–826; in hands of Commissioners, 15,363–5; from a well, not constant, 15,762; hard and quite insufficient. 15,694–701, 15,821–2, 15,865–8, **16,633**. Private wells occasionally infiltrated with sewage, 16,649–54.

Ravensthorpe; none, 3113–8.

Skipton; *See* evidence of manager of works, Mr. Calvert, 14,923,15,008,15,295–308. A constant system by gravitation, 14,964–75. Usually 20 gallons per head, 14,960; but liable to run short, 15,241–2, 15,295–308.

Thornhill; none. *See* evidence of Mr. Maddison, 2930–63, 2934, 3073–6, 3084–5.

Villages; generally poor, streams, which are natural sources, being polluted, and artificial waterworks not yet having been established, 5469–70, 5557, 5604, 7299, 16,609. Bradford supplies neighbouring villages, 7298. Halifax also, 10,892–3, 11,591–4.

Wakefield. *See* evidence of manager of works, Mr. Sykes, 831–1029, 1670–89. Mr. Spencer, chemist, 1714–837, 1982–2051, and Paper by Mr. Whittam, **85–86**.

In hands of private company, 23, 56–60, 75, 867–83, 1052–5, 1165–8. Source of, as to one quarter springs, as to the remainder the river Calder at a point below the town after the river has received sewage and other pollutions of town, 834–5, 24–6, 77, 94, 272, 1060. The sewerage of town hitherto partial, but sewerage is being extended, and population and manufactures are likewise increasing, 20, 76, 78–80, 93, 111, 159, 163, 1063. Mode of procuring from the river, 1670–89. Water pumped into a reservoir after a fresh, 859–60, 913, 952–3, 1670–2; then deposits, 915; then upper part of water is passed. Formerly only one reservoir; when that was being cleaned out, water pumped directly from river into mains; additional reservoirs now constructed, 1670–89. Reservoir contains fish, 957–62; Water formerly unfiltered, 851–4, and was then distinctly injurious, 461–71, 476, 505–6, 543–4 Paper; now filtered by Mr. Spencer's carbide process, 851–4. Process described, 898, 925–44, 998–1006, 1178–204. Cost of carbide, 1027–8. Effect of filtration; a very fair water produced, not injurious to health, 114–8, 146–8, 311–5, 478, 495–6, 500, 515–24, 1160, 2191; but harder in consequence of process, 486–93, 570–3, 1008–24, 1464–6; and not to be trusted, 513–4, 2153; still contains nitrogenized organic matter, 2201. Analyses, 987, 991–6, 1029. Volume of, supply constant and sufficient, 836–7, 862. Proportion of manufacturing and domestic consumption, 840. Price of, 841–4.

Possible rival schemes for, 884–96, 1066, 1713–4 Paper. Proposal for works to be bought up by county rate, 10,962–71.

II. Value to manufacturers, 2553–6, 5912–5, 6054–5, 7102–8, 7143–5, 7584, **7938–41, 8812**, 9062, 10,996–7, **11,238–40**. Cost of wells to individual manufacturers, 9135–7, 9160–7, **9193–8, 9289–93**, 11,109, **11,136–43**, 11,668, 12,208; of private reservoirs, 12,208; of water from reservoirs made by combinations amongst manufacturers, 4873–83; of water bought from public waterworks, 1462, 1470–1, 2513–6, 2735–9, 7274, **8890–1**, 10,214–7, **11,134–43**, 11,290–3, 11,374–7, 11,658–74, 12,094–100. Litigation concerning, 2329–7, 2510, 3428, 3696–708, 3822, 6303, 8697, 9118, 9642, **9933–9, 9953–4**, 10,909, 11,775–84, 12,013. Volume of water used by individual manufacturers, 1377, 2754a–59, 2829–30, 3435*–43*, 3632, 3638–43, 4290, 4579, 4846–8, 4889–93, 4903, 5294, 6782, **6806–7**, 6848–54, 6877, 6951–76, 7930, 8472, 8490–506, 9135, 9154–8, 9269–80, 9722, 9905–10, 10,294, 10,384, 10,471, 10,756, 11,024, 11,234, 11,292, 11,609, 11,842, 12,094–100, **12–336**.

III. In reference to Geological Strata.

α. From coal measures variable: contains iron at Wakefield, 1459–60; is hard at Wakefield, 147, 487–8, 1480–2, 1707, 1712–3, 3517–20, 3953; at Halifax, 11,670–4, 11,733–41; at Bradford, 10,471–6. Pure at Leeds 8356–76, 83,99–401, 10,472–3. Alkaline, at Castleford, 16,516–7; at Leeds, 5844–5.

β. From magnesian limestone; bad; is impregnated with lime at Knottingley, 16,518–22, 16,612–9, 15,700–1, 15,821–2; at Pontefract, 16,357–8.

γ. From millstone grit. Is good and soft at Bradford, 9135–7, 10,297, 10,471; at Halifax, 12,336, 12,354–9; at Keighley, 13,274–5; at Sowerby Bridge, 1706; from the Washburn, 5931–4

WEATHERHILL Mr. J., (of Batley):
Evidence of, 2312–62.

WEIRS:
On the Aire, **5770** Paper; on Bradford beck cause flooding, 8912; action of in time of flood, 5755–9, 7397–8.

[*Numbers* 2919–3467 *are repeated in the Evidence: when the reference is made to the numbers as used the second time, the numbers are distinguished by an asterisk.*]

WHITHAM, Mr., (of Wakefield):
Paper by, **85–6.**

WIGHTMAN, Dr. (of Halifax):
Evidence of, 10,809–37.

WILKINSON, Mr. (of Castleford), Agent of Aire and Calder Navigation Company:
Evidence of, 16,121–99.

WILSON, Mr. (of Leeds), Secretary of Aire and Calder Navigation Company:
Evidence of, 7468–505.

WILSON, Mr., (of Wakefield):
Evidence of, 1617–41.

WILSON, Mr. W. (of Castleford):
Evidence of, 16,484–517.

WIRE MANUFACTURE:
See evidence of Mr. F. Smith of Halifax, 11,283–361. Refuse from, oxide of iron, and green vitriol, and spent sulphuric acid, thrown into river, 11,344.

WOOD, Mr., (of Dewsbury):
Evidence of, 2202–260.

WOOD, Mr. W. (of Pontefract):
Evidence of, 15,704–749.

WOOL MANUFACTURE:
For general information concerning, *see* evidence of Mr. Hirst, secretary of Chamber of Commerce at Leeds, 7877–7922; Mr. Mellor, president of Chamber of Commerce at Huddersfield, 4147–4285; Mr. Ripley, president of Chamber of Commerce at Bradford, 10,435–639; statistics by Mr. Behrens, vice-president, 10,808–9.
Weight of wool used by individual manufacturers, 1504, 2578–9, 3570, 4182, 4319, 4583–91, 4848, 6847, 7270, 9178–85, 9265–8, 9902, 10,400, **10,566–7,** 11,053 11,110, 11,383, 11,616, 12,108, 12,226, 12,335, 14,493, 14,524. Process of washing, 1394, 1402, 1507, 3615, 3644, 7239–60, 14,436, 14,540–3, 10,421–34, 14,506–10. See also *Grease Extraction, Dye Waste, Liquid.* Unwashed wool before scouring will, if soaked, yield potash, 371–7, 442–7. Much wool waste in river, 756–63, 1540–3, 4643–54.

WOOL MANUFACTURERS:
Witnesses examined,
